 PT Collection of binding groups for determining or typing samples,
 PT especially clinical samples, has groups capable to identify essentially
 PT all members of the family of nucleic acids of relatively high
 PT significance.
 XX
 PS Disclosure; Page 42; 166pp; English.
 XX
 CC The present invention describes a collection of binding groups for a
 CC family of nucleic acids comprising members of relative high and relative
 CC low significance, where the binding groups are selected to be capable to
 CC identify, alone or in combination, essentially all members of the family
 CC of nucleic acids of relatively high significance. The collection of
 CC binding groups is useful for typing of nucleic acid in a clinical sample,
 CC by contacting the nucleic acid with the collection and determining
 CC whether one or more binding groups bound to the nucleic acid of the
 CC sample. This method is useful for determining whether the sample
 CC comprises at least a part of a member of relatively high significance of
 CC a family of nucleic acids. The collection of binding groups is useful for
 CC diagnosing the severity of a disease caused by a pathogen containing a
 CC member of a family of nucleic acids. ABL88779 to ABL89321 represent
 CC oligonucleotide sequences used in the exemplification of the present
 CC invention

 XX
 CC The invention relates to an isolated nucleic acid from a human gene
 CC encoding aminopeptidase P (XPNEP2), bradykinin receptor B1 (BDKRB1),
 CC tachykinin receptor B1 (TACR1), C1 esterase inhibitor (C1NH), kallikrein
 CC 1 (KLK1), bradykinin receptor B2 (BDRKB2), angiotensin converting enzyme
 CC 2 (ACE2) or protease inhibitor 4 (PI4), comprising at least one
 CC polymorphic position. Also included are (1) a probe that hybridises to a
 CC polymorphic position as provided in the detailed summary of single
 CC nucleotide polymorphisms comprising additional 5' and 3' flanking genomic
 CC sequence; (2) analysing (M1) at least one nucleic acid sample comprising
 CC obtaining the sample from one or more individuals and determining the
 CC nucleic acid sequence at one or more polymorphic positions in a gene
 CC encoding a protein selected from the group above; (3) constructing (M2)
 CC haplotypes using the genes comprising grouping at least two nucleic acids
 CC ; (4) identifying (M3) an individual at risk of developing a disorder
 CC upon administration of an ACE inhibitor and/or vasopeptidase inhibitor
 CC using the polymorphic data; (5) a library of nucleic acids, each of which
 CC comprises one or more polymorphic positions within a gene encoding a
 CC human protein selected from the group above; and (6) genotyping (M4) an
 CC individual comprising obtaining a nucleic acid sample, determining the
 CC nucleotide present in at least one polymorphic position, and comparing at
 CC least one position with a known data set. The genes, (M1, M2, M3 and M4)
 CC and compositions are useful for detecting, diagnosing, treating,
 CC preventing various disorders such as angioedema and diseases which
 CC involve angiogenesis like haemangiomas, tumours, sarcomas, Crohn's
 CC disease, trachomas, and cardiovascular diseases like angina pectoris,
 CC hypertension, heart failure, myocardial infarction, ventricular
 CC hypertrophy, vascular diseases, aneurysm, embolism, thrombosis, coronary
 CC artery disease, arteriosclerosis and/or atherosclerosis, and
 CC hypersensitivity reactions, sepsis, autoimmune diseases, inflammatory
 CC arthritis, cancer, wounds, viral, bacterial or fungal infection, Chronic
 CC obstructive pulmonary disease (COPD) and enterocolitis (many other
 CC diseases and disorders are listed in the specification). The
 CC polynucleotides are also useful for chromosome identification. Antibodies
 CC against the proteins may be utilized for immunophenotyping of cell lines
 CC and biological samples. The present sequence represents or contains the
 CC region surrounding a single- nucleotide polymorphism in one of the genes
 CC encoding one of the proteins listed above

 XX Increasing resistance to physiological disease in plant, by integrating
 PT gene or its fragment encoding senescence-induced deoxyhypusine synthase
 PT or eIF5A in antisense orientation into plant genome and growing the
 PT plant.
 XX Example 6; Page 42; 114pp; English.
 CC The invention relates to increasing resistance to physiological disease
 CC in a plant, involving integrating into the plant genome a vector having
 CC antisense sequences complementary to corresponding portion of one strand
 CC of DNA encoding endogenous senescence-induced eIF-5A (eukaryotic
 CC initiation factor 5A) gene or 3' end of endogenous senescence-induced
 CC deoxyhypusine synthase (DHS), a portion of RNA sequence encoded by eIF-5A
 CC gene or DHS gene, and growing the plant. Also included is a plant or its
 CC progeny, where the plant is derived from a cell having inhibited or
 CC reduced expression of senescence-induced DHS, senescence-induced eIF-5A,
 CC or both, where the cell is produced by the method of the invention. The
 CC method is useful for increasing resistance to physiological disease such
 CC as blossom end rot in a plant. The method results in delayed onset of
 CC senescence and improved resistance to environmental stress and pathogens,
 CC thus extending the plant shelf-life and/or growth period. The method
 CC delays deterioration and spoilage of perishable fruits, flowers,
 CC vegetables, and plants, increases the shelf-life of perishable fruits,
 CC flowers, vegetables, and plants, and renders their tissues more stress-
 CC tolerant and pathogen resistant. The present sequence is a PCR primer
 CC used to isolate a partial Arabidopsis deoxyhypusine synthase cDNA

 XX Arraying genome clones.
 XX Claim 4; Page 35; 528pp; Japanese.
 XX The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates; (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant amplified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the markers is changed so that the same discrimination Nos. succeed to the maximum in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified discrimination Nos. are mixed respectively in each wells of longitudinal and lateral directions; (f) the mixed clones are cultured and the resultant cultures are amplified by using the above primer; (g) signals are detected from the amplified products; (h) the clones in the multiwell plates are specified from the detected result; and (i) the clones are reconstituted as the positions on the chromosome and arrayed. The microarray is useful for gene analysis. ABL42957 to ABL45322 represent PCR primers for human chromosome 1p36-35 DNA, and ABL45323 to ABL45634 represent PCR primers for human chromosome 21q22.1, which are specifically claimed for use in the present invention

 DR Ribozymes having modified bases and methods for producing them - for use
 XX in inhibiting disease related genes.
 PT Claim 2; Page 252; 407pp; English.
 XX The present sequence represents a preferred target sequence for an
 CC enzymatic nucleic acid (i.e. a ribozyme) which cleaves TNF-alpha mRNA at
 CC the nucleotide base position indicated in the DE line. Regions of the
 CC mRNA that do not form secondary folding structures and that contain
 CC potential hammerhead and hairpin ribozyme cleavage sites were identified
 CC by computer analysis. Ribozymes directed against these mRNA sequences
 CC were designed and synthesised with modifications that improve their
 CC nuclease resistance. The ribozymes are designed to cleave the target
 CC sequences and thereby inhibit TNF-alpha expression, making them
 CC potentially useful for treating rheumatoid arthritis, septic shock and
 CC other inflammatory disorders including psoriasis, as well as for
 CC treatment of AIDS. (Updated on 25-MAR-2003 to correct PI field.)

PT Killing or inhibiting bacterial growth by using a peptide nucleic acid.
XX
XX
PS Example 18; Page 31; 97pp; English.
XX
XX
CC A method has been developed for killing or inhibiting the growth of
CC bacteria by contacting the bacteria with a peptide nucleic acid (PNA).
CC The PNA is targeted to messenger or ribosomal RNA. The antibacterial
CC composition has bacteriostatic and bactericidal properties. The PNA can
CC be used to treat a mammal suffering from a bacterial infection where the
CC PNA is complementary to a region of ribosomal RNA and of mRNA of the
CC bacteria. Further treatment may include concurrent treatment with an
CC antibiotic. The PNA can also be used as a method of disinfection by
CC selecting an object to be disinfected, contacting the object with PNA (in
CC solution) and rinsing the object with a sterile liquid to remove the PNA.
CC The invention provides new ways of tackling bacterial infections which
CC have become resistant to frequently used antibiotics. The present
CC sequence represents a PNA from an example of the present invention

XX Determining bacterial target gene function, involves preparing peptide
XX nucleic acid (PNA) compounds complementary to bacterial nucleotide
XX sequence, determining activity of PNA, contacting active PNA compounds
XX and determining the effect.
XX
XX Example 5; Col 13; 34pp; English.
XX
XX The present sequence represents an egl linked peptide nucleic acid (PNA),
XX which is used in the method of the invention. The specification describes
XX a method for determining target gene function in bacteria. The method
XX comprises providing a nucleotide sequence of the target gene from the
XX bacteria, selecting and preparing PNAs with regions complementary to a
XX part of the nucleotide sequence, in anti-parallel orientation.
XX determining activity of PNA by selected assay to identify active PNA
XX compounds, contacting the bacteria with the active PNA compounds, and
XX determining effect of these on the bacteria. The method is useful for
XX determining the function of target gene in a bacteria. The method is also
XX useful in the design of antisense antibacterial drugs and gene function
XX analysis in bacteria. The method is used for killing or inhibiting of
XX bacteria

XX Killing or inhibiting growth of bacteria using peptide nucleic acids
XX complementary to a region of the bacterial ribosomal RNA is useful to
XX treat a bacterial infection in a mammal and as a disinfectant.
XX
XX Example 18; Col 18; 32pp; English.
XX
XX The patent discloses methods and compositions for killing or inhibiting
XX growth of bacteria comprising contacting the bacteria with a peptide
XX nucleic acid (PNA) complementary to a region of the bacterial ribosomal
XX RNA. The method is used to treat a bacterial infection in a mammal and as
XX a disinfectant. The present sequence is an egl linked peptide nucleic
XX acid (PNA) which is used in the exemplification of the invention

 XX New isolated nucleic acid segments from the human genome - used for
 PT determining polymorphic forms for use in e.g. forensics, paternity
 PT testing or phenotypic typing for disease.
 XX
 PS Claim 16; Page 207; 310pp; English.
 XX
 CC AAX09121-X10268 are allele-specific oligonucleotide primers used in the
 CC isolation of various biallelic polymorphic markers found in the human
 CC genome (represented in AAX10269-X12937). These primers can be used in a
 CC method for determining polymorphic forms in an individual for use in e.g.
 CC forensics, paternity testing or for phenotypic typing for diseases such
 CC as agammaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular
 CC dystrophy, Wiskott-Aldrich syndrome, Fabry's disease, familial
 CC hypercholesterolemia, polycystic kidney disease, hereditary
 CC spherocytosis, von Willebrand's disease, familial colonic polyposis, Ehlers-Danlos
 CC syndrome, osteogenesis imperfecta, acute intermittent porphyria,
 CC autoimmune diseases, inflammation, cancer, diseases of the nervous
 CC system, infection by pathogenic microorganisms, and characteristics such
 CC as longevity, appearance (e.g. baldness, obesity), strength, speed,
 CC endurance, fertility, and susceptibility or receptivity to particular
 CC drugs or therapeutic treatments. The isolated polymorphic nucleic acid
 CC segments can also be used to produce medicaments for the treatment or
 CC prophylaxis of such diseases

 DR Ribozymes having modified bases and methods for producing them - for use
 PT in inhibiting disease related genes.
 XX
 XX Claim 2; Page 202; 407pp; English.
 XX
 XX The present sequence represents a preferred target sequence for an
 CC enzymatic nucleic acid (i.e. a ribozyme) which cleaves ICAM-1 mRNA at the
 CC nucleotide base position indicated in the DE line. Regions of the mRNA
 CC that do not form secondary folding structures and that contain potential
 CC hammerhead and hairpin ribozyme cleavage sites were identified by
 CC computer analysis. Ribozymes directed against these mRNA sequences were
 CC designed and synthesised with modifications that improve their nuclease
 CC resistance. The ribozymes cleave the ICAM-1 target sequences and thereby
 CC inhibit ICAM-1 expression, making them useful for reducing transplant
 CC rejection and alleviating symptoms in patients with rheumatoid arthritis,
 CC asthma and other inflammatory disorders. (Updated on 25-MAR-2003 to
 CC correct PI field.)

PT Novel ribozymes for modulating the synthesis, expression and/or stability of an mRNA encoding an angiogenic factors.

Claim 54; Page 233; 305pp; English.

The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl hydrocarbon nuclear transporter (ARNT) gene, an integrin subunit beta 3 gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAL16775 to AAL17167 and AAL17561 to AAL17622 represent ribozyme sequences for ARNT, and AAL17168 to AAL17560 and AAL17623 to AAL17684 represent their corresponding target sequences; AAL17685 to AAL18385 and AAL19087 to AAL19154 represent ribozyme sequences for Tie-2, and AAL18386 to AAL19086 and AAL19155 to AAL19222 represent their corresponding target sequences; AAL19223 to AAL203361 and AAL21501 to AAL21595 represent ribozyme sequences for integrin alpha 6 subunit, and AAL20362 to AAL21500 and AAL21596 to AAL21688 represent their corresponding target sequences; AAL21689 to AAL22475 and AAL23263 to AAL23342 represent ribozyme sequences for integrin subunit beta 3, and AAL22476 to AAL23262, AAL23343 to AAL23422 represent their corresponding target sequences. The ribozymes of the invention are used for modulating the synthesis, expression and/or stability of an mRNA encoding angiogenic factor, especially ARNT, integrin subunit beta-3, integrin subunit alpha-6, or Tie-2. They are especially used to treat cancer, diabetic retinopathy, age related macular degeneration (ARMD), inflammation, and arthritis, as well as neovascular glaucoma, myopic degeneration, psoriasis, verruca vulgaris, angiofibroma of tuberous sclerosis, pot-wine stains, Sturge Weber syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-Rendu syndrome, and other syndromes and diseases related to the levels of ARNT, Tie-2, integrin subunit alpha-6, or integrin subunit beta-3

WPI; 1999-591315/50.

Claim 54; Page 233; 305pp; English.

The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl hydrocarbon nuclear transporter (ARNT) gene, an integrin subunit beta 3 gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA116775 to AAA117167 and AAA117561 to AAA117622 represent ribozyme sequences for ARNT, and AAA117168 to AAA117560 and AAA117623 to AAA117684 represent their corresponding target sequences; AAA117685 to AAA118385 and AAA119087 to AAA119154 represent ribozyme sequences for Tie-2, and AAA118386 to AAA119086 and AAA119155 to AAA119222 represent their corresponding target sequences; AAA119223 to AAA120361 and AAA121501 to AAA121595 represent ribozyme sequences for integrin alpha 6 subunit, and AAA120362 to AAA121500 and AAA121596 to AAA121686 represent their corresponding target sequences; AAA121689 to AAA12475 and AAA123263 to AAA123342 represent ribozyme sequences for integrin subunit beta 3, and AAA122476 to AAA123262, AAA123343 to AAA123492 represent their corresponding target sequences. The ribozymes of the invention are used for modulating the synthesis, expression and/or stability of an mRNA encoding angiogenic factor, especially ARNT. Integrin subunit beta-3, integrin subunit alpha-6, or Tie-2. They are especially used to treat cancer, diabetic retinopathy, age related macular degeneration (AMD), inflammation, and arthritis, as well as neovascular glaucoma, myopic degeneration, psoriasis, verruca vulgaris, angiobroma of tuberosus sclerosis, pot-wine stains, Sturge Weber syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-Rendu syndrome, and other syndromes and diseases related to the levels of ARNT, Tie-2, integrin subunit alpha-6, or integrin subunit beta-3.

 PT used as antiviral agents and synthons.
 XX
 XX Claim 177; Page 151; 259pp; English.
 PS
 XX A method has been developed for the identification of a nucleic acid
 CC capable of modulating a process in a biological system. The method
 CC comprises: (a) introducing into the system a random library of nucleic
 CC acid catalysts (NAC) having a substrate binding domain (SBD), comprising
 CC a random sequence, and a catalytic domain (CD); and (b) identifying NAC
 CC in systems where modulation has occurred and/or determining the sequence
 CC of at least part of the SBDs in such systems. Nucleic acid molecules with
 CC endonuclease activity and catalytic activity, from the present invention,
 CC are used to modulate gene expression in plant and mammalian cells and to
 CC cleave target nucleic acid, particularly for treating systemic diseases
 CC caused by specific RNA, e.g. cancer, inflammation, psoriasis, non-hepatic
 CC ascites and infection. They may also be used to detect genetic drift and
 CC mutations in diseased cells and to determine c-raf RNA. Specifically NACs
 CC with RNA-cleaving activity that modulate expression of the Raf gene, are
 CC used to treat cancer, restenosis, psoriasis or rheumatoid arthritis, or
 CC generally any condition associated with the level of c-raf. Introduction
 CC of sugar/phosphate modifications increases stability against nuclease and
 CC activity. AAV90922 to AAV93877 represent NACs that can be used in the
 CC method, specifically for modulating the expression of a Raf gene

 XX PT fingerprinting and determining allele frequency of SNPs.
 XX PS Disclosure; Page 55; 111pp; English.
 XX CC A method has been developed for detecting the presence or absence of a
 CC single nucleotide polymorphism (SNP) allele in a genomic sample. The
 CC method comprises preparing a reduced complexity genome (RCG) from the
 CC genomic sample and analysing the RCG for the presence or absence of a SNP
 CC allele. The method can be used to characterise a tumour, to generate a
 CC genomic pattern for an individual genome or to generate a genomic
 CC classification code for a genome. The method can be used to assess
 CC whether a subject is at risk for developing a disease or to identify a
 CC set of SNP alleles associated with a disease. The method can also be used
 CC to perform linkage analysis. AAA35944 to AAA35947 represent sequences
 CC used in the exemplification of the present invention. AAA35948 to

 XX PS Claim 77; Page 87; 148pp; English.
 XX CC The present invention describes nucleic acids (A) that interact stably
 CC with a target sequence and contain at least one phosphorodithioate
 CC link, having endonuclease activity. (A), and more generally any catalytic
 CC nucleic acid (A') that modulates expression of the oestrogen receptor
 CC gene, are used to treat cancer (particularly of breast or endometrium),
 CC in vivo or by transplanting cells ex vivo and implanting treated cells, or
 CC for other conditions associated with levels of oestrogen receptor.
 CC Because of the high selectivity for targeted RNA, (A) can also be used to
 CC correlate inhibition of gene expression with alterations in phenotype,
 CC particularly for identification of therapeutic targets, and as research
 CC reagents (for RNA, in the same way that restriction endonucleases are
 CC used with DNA). The combination of modifications in (A) improves
 CC resistance to nucleases, binding affinity and/or activity. AAA23503 to

 PS Disclosure; Page 256; 720pp; French.
 XX
 XX The invention relates to a novel isolated 17 mer nucleic acid sequence,
 CC given in the specification, a sequence containing at least 15 consecutive
 CC nucleotides from the 17 mer sequence, a sequence with, after optimal

CC alignment, at least 80 % identity to the 17 mer sequence, a sequence that
 CC hybridizes to them under highly stringent conditions, or the complement
 CC of any of them, or the corresponding RNA. The novel isolated nucleic
 CC acids of the invention are useful as probes and primers for detecting,
 CC identifying, quantifying and/or amplifying a nucleic acid, e.g. as one
 CC component of a gene chip, in vitro as (anti)sense reagents, and for
 CC production of recombinant polypeptides. Any of the nucleic acids,
 CC polypeptides, vectors containing the nucleic acids, cells containing the
 CC vector or antibodies directed against the polypeptides are useful for
 CC preparation of pharmaceuticals for prevention and/or treatment of viral
 CC degeneration, specifically cancer but also Alzheimer's disease and
 CC schizophrenia. Analysis of the expression of the 17 mer nucleic acids in
 CC patient samples is useful for diagnosis and/or prognosis of these
 CC diseases. The polypeptides can also be used to generate antibodies, and
 CC both the polypeptide and antibodies are useful as components of protein
 CC chips. The nucleic acid sequences of the invention can be used in gene
 CC therapy. This polynucleotide sequence represents a tumour suppression
 CC related human fukutin oligonucleotide of the invention

XX Novel enzymatic nucleic acid molecules which down regulates expression of
PT a sequence encoding a subunit of nuclear factor kappa B useful for
PT treating cancer, inflammatory disorders and autoimmune diseases.
XX
XX Claim 3; Page 41; 72pp; English.
XX
XX The invention describes an enzymatic nucleic acid molecule (I) which down
CC regulates expression of a sequence encoding a subunit of nuclear factor
CC kappa B (NFkB), where (I) is an inozyme, zinzyme, G-cleaver or amberzyme
CC configuration. The enzymatic nucleic acid molecule is adapted to treat
CC cancer and is useful for down-regulating REL-A activity in a cell, for
CC treating a patient having a condition associated with the level of REL-A.
CC (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in
CC the presence of a divalent cation, especially Mg²⁺. The enzymatic and
CC antisense nucleic acid molecules are useful for treating breast, lung,
CC prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic,
CC cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or
CC multidrug resistant cancer. The method involves use of other drug
CC therapies such as monoclonal antibodies, REL-A-specific inhibitors or
CC chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate,
CC cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate,
CC gemcitabine or radiation therapy. The enzymatic and antisense nucleic
CC acid molecules are also useful for treating inflammatory disease such as
CC rheumatoid arthritis, restenosis, asthma, Crohn's disease, diabetes,
CC obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft
CC rejection, gene therapy applications, ischaemia/reperfusion injury
CC (central nervous system (CNS) and myocardial), glomerulonephritis,
CC sepsis, allergic airway inflammation, inflammatory bowel disease or
CC infection. This sequence represents the substrate of a novel enzymatic
CC nucleic acid molecule

 XX
 XX Novel enzymatic nucleic acid molecules which down regulates expression of
 PT a sequence encoding a subunit of nuclear factor kappa B useful for
 PT treating cancer, inflammatory disorders and autoimmune diseases.
 XX
 XX Claim 3; Page 41; 72pp; English.
 XX
 XX The invention describes an enzymatic nucleic acid molecule (I) which down
 CC regulates expression of a sequence encoding a subunit of nuclear factor
 CC kappa B (NFkB), where (I) is an inozyme, zynzyme, G-cleaver or anberzyme
 CC configuration. The enzymatic nucleic acid molecule is adapted to treat
 CC cancer and is useful for down-regulating REL-A activity in a cell, for
 CC treating a patient having a condition associated with the level of REL-A.
 CC (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in
 CC the presence of a divalent cation, especially Mg²⁺. The enzymatic and
 CC antisense nucleic acid molecules are useful for treating breast, lung,
 CC prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic,
 CC cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or
 CC multidrug resistant cancer. The method involves use of other drug
 CC therapies such as monoclonal antibodies, REL-A-specific inhibitors or
 CC chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate,
 CC cyclophosphamide, doxorubicin, fluorouracil carboplatin, edatrexate,
 CC gencitabine or radiation therapy. The enzymatic and antisense nucleic
 CC acid molecules are also useful for treating inflammatory disease such as
 CC rheumatoid arthritis, restenosis, asthma, Crohn's disease, diabetes,
 CC obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft
 CC rejection, gene therapy applications, ischaemia/reperfusion injury
 CC (central nervous system (CNS) and myocardial), glomerulonephritis,
 CC sepsis, allergic airway inflammation, inflammatory bowel disease or
 CC infection. This sequence represents the substrate of a novel enzymatic
 CC nucleic acid molecule

CC the expression of a target nucleic acid (tNA) sequence via binding of the
 CC compounds with the tNA sequence. The method comprises generating a
 CC library of virtual compounds in silico according to defined criteria, and
 CC evaluating in silico the binding of the virtual compounds with the tNA
 CC according to defined criteria. Also described are: (1) a method of
 CC defining a set of oligonucleotides (ONs) that modulate the expression of
 CC a tNA sequence via binding of the ONs with the tNA sequence comprising
 CC generating a library of virtual compounds in silico according to defined
 CC criteria, and evaluating in silico the binding of the virtual ONs with
 CC the tNA according to defined criteria; and (2) a method of defining a set
 CC of compounds that modulate the expression of a tNA sequence via binding
 CC of the compounds with the tNA. The methods can be used for the generation
 CC and identification of synthetic compounds having defined physical,
 CC chemical or bioactive properties. Information gathered from assays of
 CC such compounds is used to identify nucleic acid sequences that are
 CC tractable to a variety of nucleotide sequence-based technologies, e.g.
 CC antisense drug discovery and target validation. AA240852 to AA241220, and
 CC AA52701 to AA52706, represent sequences used in the exemplification of
 CC the present invention

XX Miniribozyme compounds useful for cleaving a target mRNA in a host cell,
 PT e.g. for treating AIDS, arthritis, atherosclerosis, restenosis, bacterial
 PT and prokaryotic infection.

PS Example; Fig 4; 81pp; English.

XX The specification describes miniribozyme compounds. The miniribozymes, or
 CC oligonucleotide transfer vectors containing a nucleotide sequence
 CC encoding the miniribozyme, are useful for cleaving a target mRNA in a

CC host cell. They are especially used for treating viral diseases caused by
 CC herpes simplex virus or AIDS and other inflammatory diseases such as
 CC arthritis and circulatory disorders such as atherosclerosis and
 CC restenosis, psoriasis, cervical preneoplasia, papilloma disease, bacterial
 CC and prokaryotic infection, neoplastic conditions associated with
 CC production of aberrant RNAs such as in chronic myeloid leukemia. The
 CC miniribozymes may be combined with pharmaceutically or veterinarily
 CC acceptable carriers or may be supplemented in a composition with one or
 CC more anti-viral, anti-fungal, anti-bacterial, anti-parasitic, anti-
 CC protozoan or anthelmintic agents, herbicides or pesticides. AA58685-

XX New antisense compounds targeting nucleic acids encoding human Akt-3
 PT useful for treating a disease or condition associated with Akt-3
 PT expression, or in preventing or delaying inflammation or tumor formation.

PS Claim 1; Col 40; 37pp; English.

XX The present sequence is one of a number of antisense compounds of up to
 CC 30 nucleobases in length targeted to a nucleic acid encoding human Akt-3.
 CC The antisense compounds are useful for inhibiting the expression of human
 CC Akt-3 in human cells or tissues. They are also useful for modulating the
 CC expression of Akt-3, and for treating a human or an animal suspected of
 CC having, or being prone to, a disease or condition associated with Akt-3
 CC expression. The antisense compounds may also be used as research
 CC reagents, in kits and in diagnostics, e.g. to elucidate the function of a
 CC particular gene or to distinguish between functions of various members of
 CC a biological pathway; and as a prophylactic, e.g. to prevent or delay
 CC infection, inflammation or tumour formation

XX An antisense compound targeted to a nucleic acid molecule encoding a
PT member of the human Rho family of small GTP binding proteins useful for
PT treating e.g. cancer and ischemia.

XX Example 16; Page 73; 156pp; English.

XX This invention relates to an antisense compound targeted to a nucleic
CC acid molecule encoding a member of the human Rho family of small GTP
CC binding proteins, where the antisense compound inhibits the expression of
CC the member of the human Rho family. The invention includes antisense
CC oligonucleotides AAF94580 - AAF94637 which target a RhoA nucleotide
CC sequence, AAF94645 - AAF94684 which target a RhoB nucleotide sequence,
CC AAF94686 - AAF94725 which target a RhoC nucleotide sequence, AAF94769 - AAF94790 which
CC target a Rac 1 nucleotide sequence and AAF94795 - AAF94809 which target
CC cdc42 nucleotide sequence. The antisense compound is useful for treating
CC hyperproliferative conditions, especially cancer, abnormal wound healing
CC or clotting conditions and ischaemia/reperfusion or reoxygenation injury.
CC The compound may also be used to diagnose the above conditions

XX Novel murine p97 polypeptides and polynucleotides for preparing
PT experimental models to study murine p97 and to identify modulators of
PT murine p97 expression or activity useful for treating neurological
PT conditions.

XX Example 1; Page 46; 70pp; English.

XX The invention relates to mouse p97 protein, mp97 (a scialoglycoprotein)
CC and its corresponding cDNA molecule. Mouse p97 protein and its DNA
CC molecule are useful for identifying compounds that affects mp97 protein
CC activity or expression. The invention also relates to a method for
CC screening therapeutic agents which are useful for treating neurological
CC conditions, such as cancer, neurodegenerative diseases (e.g., Alzheimer's
CC disease, Parkinson's disease, Huntington's disease), demyelinating
CC diseases (e.g., multiple sclerosis), amyotrophic lateral sclerosis,
CC bacterial and viral infections, deficiency diseases (e.g., Wernicke's
CC disease, nutritional polyneuropathy), epilepsy, psychosis, pain and
CC neurological disorders, especially Alzheimer's disease. Mouse p97 DNA's
CC are also useful in gene therapy. Mp97 proteins are useful for delivering
CC therapeutic agents and pharmaceuticals across the blood placenta barrier
CC as well as to other organs including liver. The invention is also useful
CC for preparing antibodies and antisense oligonucleotides, the preparation
CC of experimental systems to study mp97, and in diagnostic and therapeutic
CC applications. Transgenic p97 mice is useful for identifying essential
CC physiological roles for p97 in development and adult functioning of the
CC organism and for testing potential therapeutic and diagnostic agents that
CC are conjugated to p97 protein. The present DNA sequence is a RT (reverse
CC transcriptase)-PCR primer which used for cloning the missing 5' portion
CC of mouse p97 (mp97) cDNA

PT involves screening the genome of the individual for the presence or
PT absence of one or more polymorphic variants of the XRC3 gene.
XX
PS Example; Page 14; 35pp; English.
XX
CC The invention relates to a method for determining whether an individual
CC is likely to be susceptible to malignant melanoma, and determining the
CC genetic basis for the melanoma in an individual. The method involves
CC screening the genome of the individual for the presence or absence of
CC one or more polymorphic variants of the XRC3 gene. Sequences AAH47421-423
CC represent PCR primers used in a genotyping assay of a candidate DNA
CC repair gene ERRC1 (at position 19007 in exon 4)

PT Set of novel map-related biallelic markers, preferably located on obesity
PT disorder-associated chromosomal regions on chromosomes 3, 10 and 19.
PT useful, for e.g. detecting statistical correlations between marker allele
PT and a phenotype.
XX
PS Example 2; Page 287; 31pp; English.
XX
CC The invention relates to a set of novel map-related biallelic markers,
CC preferably located on obesity disorder-associated chromosomal regions on
CC chromosomes 3, 10 and 19. The markers are useful for genotyping or
CC estimating the frequency of an allele in a population, for detecting an
CC association between a genotype or haplotype and a phenotype, e.g. a
CC disease involving drug responses, obesity or disorders related to
CC obesity, such as hyperuricaemia, digestive pathology, hepatic function
CC disorders, cancer, cardiovascular disease, hypertension, hyperlipidaemia,
CC insulin disorders, atheromatous disease and cardiac insufficiency. The
CC markers are useful for detecting a statistical correlation between a
CC biallelic marker allele and a phenotype and/or between a biallelic marker
CC haplotype and a phenotype. This sequence represents a PCR primer used to
CC amplify a human obesity-associated biallelic marker

PT Arraying genome clones.

```

XX PS Claim 4; Page 14; 528pp; Japanese.

XX CC The present invention describes a method of arraying genome clones. The

XX CC method comprises: (a) clones of the genomic libraries contained in

XX CC multiwell plates numbered for discrimination are mixed in each of the

XX CC multiwell plates; (b) a primer designed based on the chromosome marker

XX CC sequence is added to the mixture to carry out an amplification reaction;

XX CC (c) a signal corresponding to the marker is detected from the resultant

XX CC amplified product to specify the discrimination Nos. of the multiwell

XX CC plates containing the clones having said marker sequence; (d) the order

XX CC of the markers is changed so that the same discrimination Nos. succeed to

XX CC the maximum in the specified discrimination Nos. to array the multiwell

XX CC plates; (e) the clones in the multiwell plates of the specified

XX CC discrimination Nos. are mixed respectively in each wells of longitudinal

XX CC and lateral directions; (f) the mixed clones are cultured and the

XX CC resultant cultures are amplified by using the above primer; (g) signals

XX CC are detected from the amplified products; (h) the clones in the multiwell

XX CC plates are specified from the detected result; and (i) the clones are

XX CC reconstituted as the positions on the chromosome and arrayed. The

XX CC microarray is useful for gene analysis. ABU42957 to ABU45322 represent

XX CC PCR primers for human chromosome 1p36-35 DNA, and ABU45323 to ABU45634

XX CC represent PCR primers for human chromosome 21q22.1, which are

XX CC specifically claimed for use in the present invention

PT Determining a predisposition for or the occurrence of neurodegenerative

PT disease, e.g. Alzheimer's disease by detecting in a target nucleic acid

PT the presence or absence of an allelic variant of one or more polymorphic

PT regions.

XX Example 2; Page 267; 848pp; English.

XX CC The present invention relates to a method (M1) for determining a

XX CC predisposition for or the occurrence of neurodegenerative disease in a

XX CC subject. The method comprises detecting in a target nucleic acid obtained

XX CC from the subject the presence or absence of an allelic variant of one or

XX CC more polymorphic regions of one or more genes selected from uPA

XX CC (urokinase plasminogen activator), SNCG (gamma-synuclein), IDE (insulin-

XX CC degrading enzyme), KNSL1 (Kinesin-like factor protein 1), LIPA (lysosomal acid

XX CC lyase), and TNFRSF6 (Tumour Necrosis Factor Receptor-SF6), where the

XX CC presence of at least one of the allelic variant of one or more

XX CC polymorphic regions is indicative of a predisposition for or the

XX CC occurrence of neurodegenerative disease. The genes are all located on

XX CC chromosome 10. M1 is useful for determining a predisposition for or the

XX CC occurrence of, and for treating neurodegenerative disease, particularly

XX CC Alzheimer's disease. The present sequence is a PCR primer, which was used

XX CC in the method of the invention.

XX PT Sequencing complex genomes, present as fragments in a cosmid library - by

XX PT sequencing end-specific nucleotides of each clone then correlating with

XX PT spatial relationship of cosmid, esp. for mammalian chromosomes.

XX PS Example 4; Page 72; 128pp; English.

XX CC Sequences were determined from the ends of chromosome 11-specific cosmids

XX CC by automated sequencing without intermediate subcloning. A sample of 371

CC DNA sequence fragments were determined and of these, 277 were suitable
 CC for STS primer prediction by computer analysis (using the "Primer"
 CC program available from B.Lander, MIT). The STSS and cosmids were mapped
 CC by in situ hybridisation, somatic cell hybrid analysis or both. Using
 CC this method, 370 STSs specific for human chromosome 11 were generated and
 CC most of them were regionally mapped. This procedure illustrates a novel
 CC method for sequencing complex genomes, designated "sequence sampled
 CC mapping". The sequence sampled mapping method is useful for the
 CC completion of high density sequence-based maps, and ultimately, for the
 CC complete sequencing of genomic DNA directly from cosmid clones. See
 CC AAQ82001-Q82706 for STS primers. (Updated on 25-MAR-2003 to correct PN
 CC field.)

XX Nevoid basal cell carcinoma syndrome tumour suppressor gene - useful for
 XX detection of pre-disposition to basal cell carcinoma(s).

XX Claim 3; Page 79; 148pp; English.

XX This primer is used for the PCR amplification of exon 21 of a nevoid
 XX basal cell carcinoma syndrome (NBCCS) (PTC) protein encoding cDNA. The
 XX NBCCS nucleic acid specifically hybridises, under stringent conditions,
 XX to a second nucleic acid consisting of a 6566 (full-length sequence),
 XX 1732 (exon 1a, b) (AAV15998) or 659 (exon 2a) (AAV15999) base pair
 XX sequence, in the presence of a human genomic library. The PTC polypeptide
 XX when presented as an antigen elicits the production of an antibody which
 XX specifically binds to a polypeptide encoded by the above three sequences.
 XX The NBCCS gene and its protein product is a tumour suppressor, and is a
 XX homologue of the Drosophila PATCHED (PTC) gene. Detection of the NBCCS
 XX nucleic acid, in particular abnormal sequences, by hybridisation assays
 XX is useful for detecting a predisposition to NBCCS or to a basal cell
 XX carcinoma (also known as Gorlin syndrome). Alternatively, detection of the
 XX polypeptide and is carried out by immunoassay. Vectors comprising
 XX this nucleic acid can be used to treat NBCCS. The PTC polypeptide can
 XX mitigate symptoms of NBCCS in an organism. The NBCCS nucleic acid
 XX includes one or more mutations, chosen from Exon-5 693insC, Exon-17
 XX 2988del8bp, Exon-21 3538delG, Exon-22 G430T, Exon-12 1711insC, Exon-12
 XX 1639insA, Exon-16 2707delC, and Intron-17 3157-2A to G. The mutation may
 XX be a nonsense or frameshift mutation. Frameshift mutations are chosen
 XX from 244delCT, 271insA, 464insAC, 693insC, 804del37, 877delG, 929delC,

CC modulating expression of MAPK genes in cells, tissue explants or
 CC organisms by introduction of siNA; (2) kits for in vitro or in vivo
 CC delivery of siNA; (3) conjugates and/or complexes of siNA; and (4)
 CC vectors that express siNA and cells containing these vectors. MAPK siNAs
 CC have cytostatic, anorectic, antidiabetic, antiinflammatory,
 CC antiasthmatic, immunosuppressive, antibacterial, antirheumatic,
 CC antiarthritic, antipsoriatic and gastrointestinal activities. The MAPK
 CC siNAs can be used to modulate the expression of MAPK genes, in cells,
 CC tissue explants or organisms, e.g. for treating obesity; diabetes types I
 CC and II; a wide range of tumours, and inflammatory diseases (asthma,
 CC septic shock, rheumatoid arthritis, psoriasis and inflammatory bowel
 CC disease). They can also be used for drug screening; diagnosis; target
 CC identification and validation; genetic engineering; pharmacogenomics;
 CC studying gene function and gene mapping (e.g. of single-nucleotide
 CC polymorphisms). The present sequence represents a MAPK siNA which is used
 CC in the exemplification of the present invention.

PS Example 3; SEQ ID NO 598; 164bp; English.

XX The present invention describes a short interfering nucleic acid (siNA)
 CC that downregulates expression of a mitogen-activated protein kinase
 CC (MAPK) genes by RNA interference. Also described: (1) a method for
 CC modulating expression of MAPK genes in cells, tissue explants or
 CC organisms by introduction of siNA; (2) kits for in vitro or in vivo
 CC delivery of siNA; (3) conjugates and/or complexes of siNA; and (4)
 CC vectors that express siNA and cells containing these vectors. MAPK siNAs
 CC have cytostatic, anorectic, antidiabetic, antiinflammatory,
 CC antiasthmatic, immunosuppressive, antibacterial, antirheumatic,
 CC antiarthritic, antipsoriatic and gastrointestinal activities. The MAPK
 CC siNAs can be used to modulate the expression of MAPK genes, in cells,
 CC tissue explants or organisms, e.g. for treating obesity; diabetes types I
 CC and II; a wide range of tumours, and inflammatory diseases (asthma,
 CC septic shock, rheumatoid arthritis, psoriasis and inflammatory bowel
 CC disease). They can also be used for drug screening; diagnosis; target
 CC identification and validation; genetic engineering; pharmacogenomics;
 CC studying gene function and gene mapping (e.g. of single-nucleotide
 CC polymorphisms). The present sequence represents a MAPK siNA which is used
 CC in the exemplification of the present invention.

XX
XX Claim 2; Page 201; 407pp; English.
XX
CC The present sequence represents a preferred target sequence for an
CC enzymatic nucleic acid (i.e. a ribozyme) which cleaves ICAM-1 mRNA at the
CC nucleotide base position indicated in the DE line. Regions of the mRNA
CC that do not form secondary folding structures and that contain potential
CC hammerhead and hairpin ribozyme cleavage sites were identified by
CC computer analysis. Ribozymes directed against these mRNA sequences were
CC designed and synthesised with modifications that improve their nuclease
CC resistance. The ribozymes cleave the ICAM-1 target sequences and thereby
CC inhibit ICAM-1 expression, making them useful for reducing transplant
CC rejection and alleviating symptoms in patients with rheumatoid arthritis,
CC asthma and other inflammatory disorders. (Updated on 25-MAR-2003 to
CC correct PI field.)

XX
XX The invention relates to a novel apparatus for detecting contaminants,
CC especially micro-organisms, in a fluid, preferably a blood product, which
CC comprises a primary chamber for fluid storage and a secondary chamber
CC containing at least one detection reagent, especially selected from the
CC probes AAT73231-5. The probes are targeted to bacterial rRNA sequences
CC and do not react with human leucocyte or calf rRNA sequences. This probe
CC is specific for a 16S rRNA sequence

XX
XX AAX10748-V10777 are primers used in a method to identify the novel human
CC breast cancer gene CH13-2a12-1 by differential display. The identified
CC genes or fragments of these genes can be used for identifying genes and
CC gene products that are intimately related to malignant transformation or
CC maintenance of the malignant properties of cancer cells. It can also be
CC used to design or screen diagnostic reagents or therapeutic compounds.
CC Kits are included within the scope of the invention

XX Thermostable structure-specific nuclease(s) derived from mutant DNA
PT polymerase(s) - useful for detecting mutant allele(s) or strains of
PT microorganisms.
XX
XX Example 41; Page 302; 472pp; English.
XX
XX This is the nucleotide sequence of a PCR primer used for amplification in
CC the method of the invention involving the use of structure-specific
CC nucleases. In this process thermostable structure-specific nucleases are
CC derived from mutant DNA polymerases, which can be used for detecting
CC mutant alleles or strains of microorganisms. The structure-specific
CC nucleases can be used in mixtures, compositions and kits to treat nucleic
CC acid, e.g. for detection of wild type and mutant alleles of genes, for
CC detection and/or identification of strains of microorganisms such as
CC bacteria, fungi, protozoa, especially for detection of RNA viruses such
CC as the hepatitis C virus (HCV)

 XX
 PT Identifying variations in polynucleotide sequences - using allele
 PT specific hybridisation assay, sequence variation locating assay, and
 PT direct sequencing, in a stepwise procedure.
 XX
 PS Example 1; Page 27; 62pp; English.
 XX
 CC This sequence represents a probe for a fragment of the DNA encoding the
 CC human BRCA (omil) protein, and was used to test the method of the
 CC invention. The method is for determining the presence or absence of a
 CC sequence variation in a gene sample, and comprises: (a) performing an
 CC allele specific hybridisation assay for one or more pre-determined
 CC sequence variations; (b) if no pre-determined sequence variation found in
 CC step (a) then performing a sequence variation location assay; (ci) if no
 CC sequence variation found in step (b) then sequencing the gene sample;
 CC (cii) if sequence variation is found in step (b) then targeted
 CC confirmatory sequencing is performed; and (d) determining the presence of
 CC a sequence variation by analysing the sequence(s) obtained in step (ci)
 CC or step (cii) against a reference sample. Alternatively, step (a) or step
 CC (b) is omitted from the method. The invention provides a stepwise and
 CC integrated method for the efficient and accurate detection of variations
 CC in polynucleotide sequences, being directed towards screening for
 CC diseases associated with multiple allele variations, including breast and
 CC ovarian cancer, cystic fibrosis, Duchenne and Becker muscular dystrophy,
 CC and Li-Fraumeni syndrome

 PT Novel ribozymes for modulating the synthesis, expression and/or stability
 PT of an mRNA encoding an angiogenic factors.
 XX
 PS Claim 55; Page 180; 305pp; English.
 XX
 CC The present invention describes enzymatic nucleic acid molecules with RNA
 CC cleaving activity, which specifically cleave RNA encoded by an aryl
 CC hydrocarbon nuclear transporter (ARNT) gene, an integrin subunit beta 3
 CC gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to
 CC AAA17167 and AAA17561 to AAA17622 represent ribozyme sequences for ARNT,
 CC and AAA17168 to AAA17560 and AAA17623 to AAA17684 represent their
 CC corresponding target sequences; AAA17685 to AAA18385 and AAA19087 to
 CC AAA19154 represent ribozyme sequences for Tie-2, and AAA18386 to AAA19086
 CC and AAA19155 to AAA19222 represent their corresponding target sequences;
 CC AAA19223 to AAA20361 and AAA21501 to AAA21595 represent ribozyme

sequences for integrin alpha 6 subunit, and AAA20362 to AAA21500 and
 CC AAA21596 to AAA21688 represent their corresponding target sequences;
 CC AAA21689 to AAA22475 and AAA23263 to AAA23342 represent ribozyme sequence
 CC for integrin subunit beta 3, and AAA22476 to AAA23262, AAA23343 to
 CC AAA23422 represent their corresponding target sequences. The ribozymes of
 CC the invention are used for modulating the synthesis, expression and/or
 CC stability of an mRNA encoding angiogenic factor, especially ARNT,
 CC integrin subunit beta-3, integrin subunit alpha-6, or Tie-2. They are
 CC especially used to treat cancer, diabetic retinopathy, age related
 CC macular degeneration (ARMD), inflammation, psoriasis, verruca vulgaris,
 CC neovascular glaucoma, myopic degeneration, psoriasis, verruca vulgaris,
 CC angiofibroma of tuberous sclerosis, pot-wine stains, Sturge Weber
 CC syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-Rendu syndrome,
 CC and other syndromes and diseases related to the levels of ARNT, Tie-2,
 CC integrin subunit alpha-6, or integrin subunit beta-3

 XX DR
 XX PT Modifying nucleotide sequence, including recombination of genes in (non-
 XX PT)human cell, comprises introducing DNA-modifying molecule into cell cycle
 XX PT synchronized cell.
 XX PS Example 2; Fig 1; 67pp; English.
 XX CC The specification describes a method for modifying a nucleotide sequence
 XX CC in the genome of a cell. The method comprises providing a cell and a DNA-
 XX CC modifying molecule, manipulating the cell to generate a synchronized cell
 XX CC and contacting the synchronized cell with the DNA-modifying molecule
 XX CC under conditions such that a modification in the nucleotide sequence is
 XX CC produced. The method is useful for modifying nucleotide sequences in the
 XX CC genome of a human or non-human cell including a fertilized egg cell from
 XX CC an animal such as sheep, pig, rabbit, cattle and a mouse cell such as
 XX CC blastomere, eight-cell embryo cell, blastocoele, midgestation embryo cell
 XX CC and embryonic stem cell. The cell is preferably DNA repair-deficient. The
 XX CC method is useful for introducing a modification into the genome of a cell
 XX CC for determining the effect of the modification on the cell. The method
 XX CC generates transgenic cells and animals useful as models for diseases, and
 XX CC for screening therapeutic agents. The method also facilitates targeted
 XX CC recombination for producing gene knockout organisms and/or replacement of
 XX CC defective genes with non-defective genes. Further the method is useful
 XX CC for determining the function of a gene of unknown function. AA165848-49
 XX CC represent target sequences, derived from exon 4 and exon 5 of the chinese
 XX CC hamster Hpvt gene. The sequence is modified using the method of the
 XX CC invention by AA165850-54, which represent triplex forming
 XX CC oligonucleotides

 XX Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense
 PT

constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury.

Claim 88; Page 137; 200pp; English.

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NIGO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a DNzyme) an inozyme (an endolytic nucleic acid cleaving an RNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with a NYN motif) or an amberzyme (cleaving RNA with an NGN triplet), a zinczyme (cleaving RNA with a YGY motif). The CD20-targeting nucleic acid is used to cleave RNA of CD20 in the presence of a divalent cation that is preferably Mg²⁺. Furthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more therapies. In particular, the CD20 targeting nucleic acid may be used to treat lymphoma, leukemia, B-cell lymphoma, low-grade or follicular non-Hodgkin's lymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic leukaemia, HIV (human immunodeficiency virus) associated NHL, lymphocytic leukaemia (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, immune thrombocytopaenia, and inflammatory arthropathy. The NIGO-targeting nucleic acid is used to cleave RNA of the NIGO gene in the presence of a divalent cation that is preferably Mg²⁺. Furthermore, the nucleic acid may be contacted with a cell to reduce NIGO activity of the cell and treat a patient having a condition associated with the level of NIGO. The treatment may further comprise the use of one or more therapies. In particular, the NIGO-targeting nucleic acid may be used to treat central nervous system (CNS) injury and cerebrovascular accident (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS), chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS), Parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob disease, muscular dystrophy, and/or other neurodegenerative disease states which respond to the modulation of NIGO expression. The present sequence is an amberzyme molecule of the invention

XX Claim 88; Page 133; 200pp; English.
XX
XX The invention relates to a nucleic acid molecule which down regulates
CC expression of a CD20 gene and a nucleic acid molecule which down
CC regulates expression of a neurite growth inhibitor gene (NOGO). The
CC nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a
CC DNazyme) an inozyme (an endolytic nucleic acid cleaving an RNA molecule
CC possessing an NCH motif), a G-cleaver (cleaving RNA with a NYN motif) or
CC an amberzyme (cleaving RNA with an NGN triplet), a zinczyme (cleaving RNA
CC with a YGY motif). The CD20-targeting nucleic acid is used to cleave RNA
CC of CD20 in the presence of a divalent cation that is preferably Mg²⁺.
CC Furthermore, it may be contacted with a cell to reduce CD20 activity of
CC the cell and treat a patient having a condition associated with the level
CC of CD20. The treatment may further comprise the use of one or more
CC therapies. In particular, the CD20 targeting nucleic acid may be used to
CC treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-
CC Hodgkin's lymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic
CC leukaemia, HIV (human immunodeficiency virus) associated NHL, mantle-cell
CC lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma,
CC immune thrombocytopaenia, and inflammatory arthropathy. The NOGO-
CC targeting nucleic acid is used to cleave RNA of the NOGO gene in the
CC presence of a divalent cation that is preferably Mg²⁺. Furthermore, the
CC nucleic acid may be contacted with a cell to reduce NOGO activity of the
CC cell and treat a patient having a condition associated with the level of
CC NOGO. The treatment may further comprise the use of one or more

expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NOMO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a DNAzyme) an inozyme (an endolytic nucleic acid cleaving an RNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with a NVN motif) or an amberzyme (cleaving RNA with an NGN triplet), a zynzyme (cleaving RNA with a YGY motif). The CD20-targeting nucleic acid is used to cleave RNA of CD20 in the presence of a divalent cation that is preferably Mg²⁺. Furthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more therapies. In particular, the CD20 targeting nucleic acid may be used to treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-Hodgkin's lymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic leukaemia, HIV (human immunodeficiency virus) associated NHL, mantle-cell lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, immune thrombocytopenia, and inflammatory arthropathy. The NMOG-targeting nucleic acid is used to cleave RNA of the NMOG gene in the presence of a divalent cation that is preferably Mg²⁺. Furthermore, the nucleic acid may be contacted with a cell to reduce NMOG activity of the cell and treat a patient having a condition associated with the level of NMOG. The treatment may further comprise the use of one or more therapies. In particular, the NMOG-targeting nucleic acid may be used to treat central nervous system (CNS) injury and cerebrovascular accident (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS), chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS), Parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob disease, muscular dystrophy, and/or other neurodegenerative disease states which respond to the modulation of NMOG expression. PT New rice cysteine proteinase gene promoter, useful in stress-induced regulation of heterologous proteins in plants or plant cells, or as

PT probes for isolating promoters or genes whose expression stress-induced or during senescence.
PS Disclosure; Col 6; 10pp; English.
CC The invention relates to a new promoter derived from rice cysteine proteinase (CysP) gene (OsEP3A). The promoter directs the expression of a heterologous protein in the aleurone layer of transgenic rice seeds during germination and in cultured rice suspension cells under nitrogen starvation. The nucleic acids can be used as probes to isolate other promoters and/or genes whose expression is induced under stress or during senescence, and in stress-induced regulation of heterologous proteins in plants (including embryos, organs and seeds) or plant cells. The present sequence represents a PCR primer for amplifying a OsEP3A DNA fragment

 CC The present invention describes a human genome-derived myosin-like
 CC protein 1 (hGDMPL-1). The protein and polynucleotide sequences of hGDMPL-
 CC 1 can be used in gene therapy and vaccine production. The hGDMPL-1
 CC nucleic acids can be used as probes to detect, characterize and quantify
 CC hGDMPL-1 nucleic acids in samples, as amplification substrates, to
 CC provide initial substrates for the recombinant engineering of hGDMPL-1
 CC protein variants having desired phenotypic improvements, and for
 CC expressing the proteins. The hGDMPL-1 proteins or polypeptides may be
 CC used as immunogens to raise antibodies that specifically recognise hGDMPL
 CC -1 proteins, as standards in assays used to determine the concentration
 CC and/or amount specifically of hGDMPL proteins, as specific biomolecule
 CC capture probes for surface-enhanced laser desorption ionisation, as
 CC therapeutic supplement in patients having specific deficiency in hGDMPL-1
 CC production, and in vaccines or for replacement therapy. The
 CC polynucleotide sequences encoding hGDMPL-1 may be used for diagnosing a
 CC disorder associated with the expression of hGDMPL-1, in particular heart
 CC and skeletal muscle disorders. hGDMPL-1 is localised to chromosome 22.
 CC The present sequence represents an oligomer used in the screening of the
 CC hGDMPL-1 sequence in the exemplification of the present invention. N.B.
 CC The sequence data for this patent did not form part of the printed
 CC specification, but was obtained in electronic format directly from WIPO
 CC at ftp.wipo.int/pub/published_pct_sequence

 PT New polypeptide, for raising antibodies that recognize hGDMPLP-1 proteins,
 or as specific biomolecule capture probes for surface-enhanced laser
 desorption ionization, comprises human myosin-like protein hGDMPLP-1.
 PT
 XX
 PS Disclosure; SEQ ID NO 661; 214pp; English.
 XX
 CC The present invention describes a human genome-derived myosin-like
 protein 1 (hGDMPLP-1). The protein and polynucleotide sequences of hGDMPLP-1
 can be used in gene therapy and vaccine production. The hGDMPLP-1
 nucleic acids can be used as probes to detect, characterize and quantify
 hGDMPLP-1 nucleic acids in samples, as amplification substrates, to
 provide initial substrates for the recombinant engineering of hGDMPLP-1
 protein variants having desired phenotypic improvements, and for
 expressing the proteins. The hGDMPLP-1 proteins or polypeptides may be
 used as immunogens to raise antibodies that specifically recognise hGDMPLP
 -1 proteins, as standards in assays used to determine the concentration
 and/or amount specifically of hGDMPLP proteins, as specific biomolecule
 capture probes for surface-enhanced laser desorption ionisation, as
 therapeutic supplement in patients having specific deficiency in hGDMPLP-1

CC production, and in vaccines or for replacement therapy. The
 CC polynucleotide sequences encoding hGDMPLP-1 may be used for diagnosing a
 CC disorder associated with the expression of hGDMPLP-1, in particular heart
 CC and skeletal muscle disorders. hGDMPLP-1 is localised to chromosome 22.
 CC The present sequence represents an oligomer used in the screening of the
 CC hGDMPLP-1 sequence in the exemplification of the present invention. N.B.
 CC the sequence data for this patent did not form part of the printed
 CC specification, but was obtained in electronic format directly from WIPO

XX New polypeptide, for raising antibodies that recognize hGDMPLP-1 proteins,
PT or as specific biomolecule capture probes for surface-enhanced laser
PT desorption ionization, comprises human myosin-like protein hGDMPLP-1.
XX Disclosure; SEQ ID NO 662; 214pp; English.
XX The present invention describes a human genome-derived myosin-like
CC protein 1 (hGDMPLP-1). The protein and polynucleotide sequences of hGDMPLP-
CC 1 can be used in gene therapy and vaccine production. The hGDMPLP-1
CC nucleic acids can be used as probes to detect, characterise and quantify
CC hGDMPLP-1 nucleic acids in samples, as amplification substrates, to
CC provide initial substrates for the recombinant engineering of hGDMPLP-1
CC protein variants having desired phenotypic improvements, and for
CC expressing the proteins. The hGDMPLP-1 proteins or polypeptides may be
CC used as immunogens to raise antibodies that specifically recognise hGDMPLP
CC -1 proteins, as standards in assays used to determine the concentration
CC and/or amount specifically of hGDMPLP proteins, as specific biomolecule
CC capture probes for surface-enhanced laser desorption ionisation, as
CC therapeutic supplement in patients having specific deficiency in hGDMPLP-1
CC production, and in vaccines or for replacement therapy. The
CC polynucleotide sequences encoding hGDMPLP-1 may be used for diagnosing a
CC disorder associated with the expression of hGDMPLP-1, in particular heart
CC and skeletal muscle disorders. hGDMPLP-1 is localised to chromosome 22.
CC The present sequence represents an oligomer used in the screening of the
CC hGDMPLP-1 sequence in the exemplification of the present invention. N.B.
CC The sequence data for this patent did not form part of the printed
CC

CC specification, but was obtained in electronic format directly from WIPO

PT Novel isolated human testis expressed Patched like protein (HTPL), useful
PT for identifying agonist and antagonist and specific binding partners, and
PT for treating subjects having defects in HTPL.
XX
PS Example 2; Page 269; 718pp; English.
XX
CC The present invention relates to human testis expressed Patched like
CC protein (HTPL, see ABV78759 to ABV78762 and AB98519 to AB98520). HTPL
CC has two isoforms, with a few single base pair differences between the
CC two. One of the single base pair changes introduces a premature stop
CC codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL
CC shares an overall structure organisation with the Patched protein. The
CC shared structural features strongly imply that HTPL plays a role similar
CC to that of Patched, and is a potential tumour suppressor. HTPL is
CC important in regulating male germ cell development, and the HTPL gene was
CC mapped to human chromosome 10p12.1. HTPL and its coding sequence are
CC useful for diagnosing a disorder caused by mutation in HTPL, and in
CC therapy and manufacture of a medicament for treatment or prevention of
CC such disorder associated with decreased expression or activity of human
CC HTPL. Such disorders include disorders of testis, or adrenal, adult and
CC foetal liver, bone marrow, brain, kidney, lung, placenta, prostate,
CC skeletal muscle or colon function. HTPL proteins and nucleic acids are
CC clinically useful diagnostic markers and potential therapeutic agents for
CC male infertility and cancer. The present oligonucleotide was used in an
CC example from the invention

PT Polynucleotide and polypeptide of human NEDD-1 useful for diagnosing,
PT treating or preventing a disorder associated with decreased or increased
PT expression or activity of the polypeptide.
XX
PS Example 4; Page 149; 190pp; English.
XX
CC This invention relates to an isolated polynucleotide encoding human NEDD-
CC 1, which is cytostatic in its action. The polynucleotide is useful for
CC diagnosing diseases caused by mutation in human NEDD-1, and for
CC diagnosing or monitoring diseases caused by altered expression of human
CC NEDD-1. Fragments of NEDD-1 are useful as hybridisation probes and
CC primers, and to direct expression or synthesis of epitopic or immunogenic
CC protein fragments. The proteins are useful as therapeutic supplement in
CC patients with specific deficiency in human NEDD-1 production, and for
CC treating subjects preferably with defects in NEDD-1. The present sequence
CC is a nucleotide sequence related to human NEDD-1

 XX New isolated nucleic acid encoding an isoform of human pregnancy
 PT associated plasma protein E, for preventing or aborting pregnancy.
 PT
 XX Example 2; Page 131; 353pp; English.
 PS
 XX This invention describes a novel isolated nucleic acid that encodes one
 CC of three new isoforms of human pregnancy associated plasma protein E,
 CC hPAPP-E. The products of the invention have abortive and contraceptive
 CC activity and can be used for gene therapy or in a vaccine. The nucleic
 CC acid, polypeptide encoded by it, or antibody to the polypeptide can be
 CC used in pharmaceutical compositions or vaccines for preventing or
 CC aborting pregnancy. PAPP-E is used in the antenatal diagnosis of
 CC dysgenetic pregnancies. The nucleic acids are used as probes to assess
 CC the level of PAPP-E isoform mRNA in chorionic villus samples, and the
 CC antibodies can be used to assess the expression levels of PAPP-E isoform
 CC proteins in chorionic villus samples, to diagnose dysgenetic pregnancies
 CC antenatally. This sequence represents an oligomer used in scanning the
 CC human PAPP-E genes described in the disclosure of the invention

XX Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL
PT -1, useful for treating disorders associated with decreased expression or
PT activity of human POSHL1.
XX Example 2; SEQ ID NO 45; 60pp + Sequence Listing; English.
XX The invention relates to an isolated SH3 domain (POSH)-like signalling
CC protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino
CC acids (S1, ABB83999), a sequence having 65% sequence identity to (S1),
CC (S1) having 95% deviations, especially conservative substitutions or a
CC fragment of the sequences comprising at least 8 contiguous amino acids.
CC Human POSHL 1 is a proto-oncogene/oncogene product that functions as an
CC adaptor protein that interacts with Rho family small GTPases as well as
CC downstream components of the signal transduction pathway. (I) is useful
CC for identifying a specific binding partner. (II) and nucleic acids (II)
CC encoding (I) are useful for diagnosing, monitoring disease and treating
CC caused by altered expression of human POSHL1 including diagnosing and
CC treating cancer, they are useful in the development of vaccines and (II) is
CC useful in gene therapy. (II) is useful for constructing microarrays which
CC are useful for measuring and for surveying gene expression and creating
CC transgenic non-human animals capable of producing the proteins. The
CC present sequence is that of a scanning oligonucleotide useful in examples
CC of the invention. Note: The present sequence did not form part of the
CC printed specification, but is based on sequence information supplied to
CC Derwent by the European Patent Office

 DR New composition useful for detecting and characterizing nucleic acid
 PT sequences and sequence variants for detecting the presence of viral or
 PT bacterial infections or cancer, comprises purified or chimerical FEN-1
 PT endonuclease.
 XX Example 62; SEQ ID NO 280; 871pp; English.
 PS The invention discloses a new composition (I) which comprises a purified
 CC flap endonuclease-1 (FEN-1) from e.g. Sulfolobus solfataricus,
 CC Pyrobaculum aerophilum or a chimerical FEN-1 endonuclease having a
 CC portion of the above endonuclease in addition to that of Pyrococcus
 CC horikoshii and Aeropyrum pernix. Also claimed is a composition comprising
 CC an isolated nucleic acid sequence encoding the endonuclease mentioned
 CC above, a composition comprising a vector having the nucleic acid sequence
 CC cited above, a composition comprising a host cell and vector cited above,
 CC a mixture comprising a first structure-specific nuclease selected from
 CC the species mentioned in composition (I), and a purified second structure
 CC -specific nuclease and detecting a target sequence, comprising: (a)
 CC providing a sample suspected of containing the target sequence.

oligonucleotides capable of forming an invasive cleavage structure in the presence of the target sequence, and a FEN-1 endonuclease selected from the species cited above and (b) exposing the sample to the oligonucleotides and FEN-1 endonuclease. The second structure-specific nuclease also comprises a thermostable DNA polymerase. It has a 5' nuclease derived from a DNA polymerase altered in amino acid sequence such that it exhibits reduced DNA synthetic activity from that of the wild-type DNA polymerase but retains substantially the same 5' nuclease activity of the wild-type DNA polymerase. The second structure is selected from CLEAVASE BN enzyme, CLEAVASE DA enzyme, CLEAVASE DN enzyme, CLEAVASE DV enzyme, CLEAVASE BN/thrombin enzyme, CLEAVASE TTHDN enzyme, T. aquaticus DNA polymerase, T. thermophilus DNA polymerase, E. coli Exo III and S. cerevisiae Rad1/Rad10 complex. The nucleic acid treatment kit comprises (i) and oligonucleotides capable of forming an invasive cleavage structure in the presence of a target nucleic acid. The oligonucleotides comprise: (a) a first oligonucleotide having a 5' portion complementary to a first portion of a target nucleic acid and (b) a second oligonucleotide comprising a 5' portion complementary to a second portion of the target nucleic acid downstream of and contiguous to the first portion and a 3' portion. The 3' portion of the second oligonucleotide comprises a single 3' terminal nucleotide not complementary to the target nucleic acid. Additionally, the kit has a third oligonucleotide complementary to a third portion of the target nucleic acid upstream of the first portion of the first target nucleic acid. In detecting a target sequence, the oligonucleotides and endonuclease are mixed under conditions where an invasive cleavage structure is formed between the target sequence and the oligonucleotides if the target sequence is present in the sample, where the invasive cleavage structure is cleaved by the endonuclease to form a cleavage product. The composition is useful in detecting and characterizing specific nucleic acid sequences and sequence variants which can be used in detecting the presence of viral or bacterial infections, and other diseases such as cancer. The composition may also be used in forensic analysis or for paternity determinations. The sequence presented is a FEN -1 related DNA used within the scope of the invention.

 PT Novel enzymatic nucleic acid molecules which down regulates expression of
 PT a sequence encoding a subunit of nuclear factor kappa B useful for
 PT treating cancer, inflammatory disorders and autoimmune diseases.
 XX
 PS Claim 3; Page 47; 72pp; English.
 XX
 CC The invention describes an enzymatic nucleic acid molecule (I) which down
 CC regulates expression of a sequence encoding a subunit of nuclear factor
 CC kappa B (NFkB), where (I) is an inozyme, zinzyme, G-cleaver or amberyne
 CC configuration. The enzymatic nucleic acid molecule is adapted to treat
 CC cancer and is useful for down-regulating REL-A activity in a cell, for
 CC treating a patient having a condition associated with the level of REL-A.
 CC (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in
 CC the presence of a divalent cation, especially Mg²⁺. The enzymatic and
 CC antisense nucleic acid molecules are useful for treating breast, lung,
 CC prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic,
 CC cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or

CC multidrug resistant cancer. The method involves use of other drug
 CC therapies such as monoclonal antibodies, REL-A-specific inhibitors or
 CC chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate,
 CC cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate,
 CC gemcitabine or radiation therapy. The enzymatic and antisense nucleic
 CC acid molecules are also useful for treating inflammatory disease such as
 CC rheumatoid arthritis, restenosis, asthma, Crohn's disease, diabetes,
 CC obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft
 CC rejection, gene therapy applications, ischaemia/reperfusion injury
 CC (central nervous system (CNS) and myocardial), glomerulonephritis,
 CC sepsis, allergic airway inflammation, inflammatory bowel disease or
 CC infection. This sequence represents an enzymatic nucleic acid used to
 CC modulate the function of a necrosis factor kappa B sub-unit

XX Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases.
XX Claim 3; Page 35; 72pp; English.
XX The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B (NFkB), where (I) is an inozyme, zynzyme, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially Mg²⁺. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug therapies such as monoclonal antibodies, REL-A-specific inhibitors or chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, cyclophosphamide, doxorubicin, fluorouracil carboplatin, edatrexate, gencitabine or radiation therapy. The enzymatic and antisense nucleic acid molecules are also useful for treating inflammatory disease such as rheumatoid arthritis, restenosis, asthma, Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, gene therapy applications, ischaemia/reperfusion injury (central nervous system (CNS) and myocardial), glomerulonephritis, sepsis, allergic airway inflammation, inflammatory bowel disease or infection. This sequence represents the substrate of a novel enzymatic nucleic acid molecule

XX PT New zinc finger-containing proteins and nucleic acids, useful in
PT manufacturing a medicament for treating or preventing a disorder
PT associated with decreased or increased expression or activity of MDZ3,
PT MDZ4, MDZ7 or MDZ12, e.g. cancer.
XX Example 8; SEQ ID NO 245; 103pp; English.
XX CC The present invention relates to novel human zinc finger-containing
CC proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is
CC encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 6p21.3-22.2,
CC MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome
CC 15q26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy,
CC or in manufacturing a medicament for treating or preventing a disorder
CC associated with decreased or increased expression or activity of MDZ3,
CC MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic
CC acids and proteins are also useful for diagnosing or monitoring a disease
CC caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic
CC acids can also be used as probes to detect and characterize gross
CC alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are
CC useful in constructing microarrays for measuring gene expression. The
CC proteins are useful as therapeutic agents for gene therapy or as
CC vaccines. The present sequence was used to illustrate the invention.

XX
CC The present invention relates to nucleic acid molecules which modulate
CC the synthesis, expression and/or stability of Hepatitis C virus (HCV) or
CC Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense
CC and enzymatic nucleic acids such as hammerhead ribozymes, DNazymes,
CC inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed
CC are nucleic acid decoy molecules and aptamers that bind to HBV reverse
CC transcriptase and/or HBV reverse transcriptase primer sequences, as well
CC as oligonucleotides that specifically bind the Enhancer I region of HBV
CC DNA. The nucleic acids may be used to modulate the expression of HBV
CC genes and HBV viral replication. Also disclosed is a method for screening
CC compounds and/or potential therapies directed against HBV, and compounds
CC that modulate the expression and/or replication of HCV. The compounds and
CC methods of the invention are useful for the treatment of degenerative and
CC disease states related to HBV and HCV infection, replication and gene
CC expression such as cirrhosis, liver failure, and hepatocellular
CC carcinoma. The present sequence represents a substrate for one of the HCV
CC DNazyme or minus strand DNazyme sequences disclosed in the present
CC invention

XX Detecting several reactive sites on an analyte useful for determining
PT antigens in immunoassays, comprises reacting reactive sites with
PT microspheres comprising reactants to form reactant-reactive site pairs
PT that are detected.
XX
XX Example 3; Page 14; 20pp; English.
XX
XX This invention relates to a method of detecting several reactive sites on
CC an analyte. The method is useful for detecting several reactive sites on
CC an analyte such as a nucleic acid molecule. Optionally, the analyte is an
CC antigen molecule, the reactive site is one or more epitopes on the
CC antigen molecule, and the reactant is one or more fluorescently-labelled
CC antibody respectively specific for one or more epitopes. The antigen
CC molecule is a human chorionic gonadotropin (hCG) related molecule and the
CC reactive site is an alpha-subunit or its variant, or a beta-subunit or its
CC variant, and the reactant is a respective antibody. The method is useful
CC for determining allele zygosity of nucleic acid molecules of a genetic
CC locus having two alleles. The method is useful for determining
CC polymorphism of nucleic acid molecules of a genetic locus having multiple
CC alleles. The genetic locus is the human breast cancer 1 (BRCA1) gene. The
CC method is useful for detecting several single nucleotide polymorphisms
CC (SNPs) in target nucleic acid molecules having two or more polymorphisms.
CC The method is useful for determining parasitic and infectious diseases,
CC human immunodeficiency virus (HIV), hepatitis, influenza, adenovirus, or
CC typhoid. The method is useful for quantitating bacterial, mycoplasma,
CC fungal antigens and antibodies like Salmonella O antigens, or exotoxins.
CC The present sequence represents the human breast cancer 1, BRCA1, allele
CC specific probe 5382insC-Normal.

XX Method for the identification of subjects hypersensitive to abacavir,
PT useful for excluding patients from treatment, comprises detecting the
PT presence of the 57.1 ancestral haplotype.
XX
XX Example 2; Page 23; 43pp; English.
XX
XX This invention relates to a method for determining whether a patient will
CC show a hypersensitivity, or similar, reaction to abacavir by typing the
CC patient for presence of the 57.1 ancestral haplotype of the Major
CC Histocompatibility Complex (MHC). The ancestral haplotype is defined by
CC presence of the human leukocyte antigen (HLA) subtypes HLA-B*5701, C4A6,
CC HLA-DR7 and HLA-DQ3. Human immunodeficiency virus (HIV) is the
CC aetiological agent of a complex disease that includes progressive
CC destruction of the immune system (acquired immune deficiency syndrome,
CC AIDS) and degeneration of the peripheral nervous system. It is known that
CC some antiviral compounds which act as inhibitors of HIV replication are
CC effective agents in the treatment of AIDS. Treatment with an antiviral
CC agent occasionally leads to a range of ailments and
CC a high risk of developing a hypersensitive reaction to abacavir, a
CC nucleoside reverse transcriptase inhibitor (NRTI) antiretroviral drug
CC often used to treat HIV and AIDS. The identification method of the
CC invention may be useful for identifying patients who need to be excluded
CC from treatment with abacavir. The present sequence is that of a human
CC sequencing and PCR amplification primer which was used for SNP detection
CC on the pyrosequencing of the MHC of the invention.

 XX
 CC The invention relates to the isolation of 6327 nucleotide sequences,
 CC fragments of at least 15 consecutive nucleotides of these nucleotides, a
 CC sequence having at least 80% identity, after optimal alignment, with the
 CC nucleotides, a sequence that hybridizes under stringent conditions with
 CC the nucleotides, or the complement, or corresponding RNA, of the
 CC nucleotides. The nucleotides are used as probes or primers for detecting,
 CC identifying, quantifying and/or amplifying nucleic acids, as in vitro
 CC sense and antisense sequences, of nucleotides involved in tumour
 CC suppression or reversion, apoptosis and or viral resistance, to produce
 CC recombinant polypeptides, and to prepare transgenic animals, as
 CC experimental models. The nucleotides (also vectors containing them and
 CC cells containing the vectors), the encoded polypeptides and antibodies
 CC (Ab) against the polypeptide are useful for prevention and/or treatment
 CC of viral infections or diseases characterized by development of tumours
 CC or cell degeneration (e.g. Alzheimer's disease or schizophrenia).
 CC Analysis of the expression of the nucleotides can be used for diagnosis
 CC and/or prognosis of these diseases. The nucleotides and polypeptides can
 CC also be used to screen for their specific interactive molecules,
 CC potentially useful for treating diseases associated with abnormal
 CC expression of the nucleotides.

XX Prepn. of transforming growth factor-beta fusion protein - useful to
 PT reduce surgery recovery time and to prepare artificial skin.
 XX Disclosure; Page 40; 59pp; English.

XX A novel transforming growth factor-beta (TGF-beta) fusion protein
 CC comprises a purification tag and a TGF active fragment. The present
 CC sequence encodes a specifically claimed purification tag. Additionally,
 CC the fusion protein may comprise proteinase-sensitive linker sites and
 CC binding domain so the protein sequence may contain some or all of the
 CC following elements: purification tag; proteinase site; ECM binding
 CC site; proteinase site; TGF-beta. TGF-beta promotes wound healing, and the
 CC fusion protein can be used to reduce surgery recovery time and in the
 CC preparation of artificial skin. The inclusion of a purification tag
 CC facilitates purification of the fusion protein. The proteinase site is
 CC included to permit cleavage and release of the purification tag after
 CC purification if desired. The extracellular matrix binding site
 CC facilitates delivery of the fusion protein to the desired site of action.
 CC Delivery of the TGF-beta to the site to be treated reduces the amount of
 CC TGF-beta required to be administered to be effective and reduces the
 CC concentration of circulating TGF-beta which may result in undesirable
 CC effects

XX Novel human Zcytor7 DNA encodes a type 2 cytokine receptor - useful for
 PT treating renal, neural, pancreatic and prostatic diseases.

XX Example 1; Page 62; 72pp; English.

XX Sequences shown in AAV57517 to AAV57524 represent primers used for the
 CC PCR amplification of the cDNA encoding the Zcytor7 cytokine receptor.
 CC Zcytor7 is a ligand-binding receptor polypeptide and is a novel member of
 CC the type 2 cytokine receptor family (CRF2). An expression vector
 CC containing the Zcytor7 polynucleotide, operably linked to transcription
 CC promoter, a sequence encoding a transmembrane and intracellular domain,
 CC or both, and a transcriptional terminator can be used to transform host
 CC cells for the recombinant production of the polypeptide. The sequences
 CC can be used to study the Zcytor7 gene and to isolate ligands binding to
 CC it. Zcytor7 is preferentially expressed in the kidney, pancreas, prostate
 CC or nervous tissue. Agonists of Zcytor7 can be used to stimulate
 CC proliferation and differentiation of cell in these organs. The
 CC antagonists and agonists can also be used in the treatment of renal,
 CC neural, pancreatic and prostate diseases

XX PT HLA Class I typing - by primer-based amplification of target DNA using
XX group-specific untranslated region primer pair.
XX PS Claim 8; Page 133; 185pp; English.
XX CC AAV46054 and AAV46200-V46264 are primers used in isolating human
XX histocompatibility locus antigen (HLA-A) Class I alleles which are used
XX in a novel method of HLA Class I typing. The method involves combining a
XX group-specific untranslated region primer pair with a target DNA to allow
XX primer-based amplification of the DNA, and determining whether a nucleic
XX acid product is produced by the amplification. The ability of the primer
XX pair to produce a product is associated with a particular HLA group type.
XX The methods can be used for typing the 3 classical HLA Class I genes
XX (comprising the loci HLA-A, HLA-B, and HLA-C) in e.g. donors and hosts
XX for tissue transplantation. The initial group specific amplification
XX allows a PCR based separation of haplotypes in 95% of patient samples.
XX CC The subsequent sequencing can provide for high-resolution typing

XX PT Isolating nucleic acids encoding proteins comprising a signal peptide -
PT by translating RNA and isolating translated RNA that is associated with
PT microsomes, useful as therapeutic agents.

PS Example 2; Page 33; 45pp; English.

XX CC The present invention describes the isolation of nucleic acid (I) that
CC encodes a protein (II) having a signal peptide (SP), which comprises
CC isolating RNA molecules (III) that are associated with microsomes under
CC conditions where (III) is at least partly translated. Also described are:
CC (1) a library of (I) encoding (II) comprising SP; (2) (I) isolated by the
CC above method; and (3) (II) encoded by (I). (I) and (II) are useful
CC therapeutically, typically (II) are cell growth factors such as
CC cytokines, interleukins, colony-forming factors, possibly useful in
CC treatment of cancer. (I) are also used; as tissue and molecular weight
CC markers; as chromosome tags; to detect possible genetic disorders; as
CC hybridisation probes to identify related nucleic acid; as primers for DNA
CC fingerprinting; to generate antibodies; and in interaction trap assays to
CC identify gene encoding specific binding agents. (II) are useful in drug
CC screening, for raising antibodies (e.g. for use as immunoassay reagents)
CC and to induce an immune response. The method is more efficient and
CC reliable than the sequence trap system. It does not involve formation of
CC a fusion protein (rather natural proteins are selected) and (II) do not

CC have to be secreted. The present sequence represents a PCR primer which
CC is used in an example from the present invention

XX Determination of HLA class I group type of a subject - using group
XX specific untranslated region primer pair.
XX Example; Page 21; 195pp; English.
XX The present invention describes a method using novel primers involving
XX the PCR-based determination of histocompatibility locus antigen B (HLA-B)
XX Class I group type. Determining the HLA-B class I group type of a subject
XX comprises: (i) combining a group-specific untranslated region primer pair
XX with a target DNA sample from the subject under conditions such that
XX primer-based amplification of the target DNA may occur; and (ii)
XX determining whether a nucleic acid product is produced by the
XX amplification; where the ability of the primer pair to produce a nucleic
XX acid product is associated with a particular HLA group type. The method
XX can be used for HLA-B typing. In the method, the initial group specific
XX amplification allows a PCR based separation of haplotypes in 95% of
XX patient samples. It permits the resolution of cis/trans linkages of
XX heterozygote sequencing results which cannot be achieved with other
XX protocols. AAX37845 to AAX38286 represent DNA sequence used in the
XX exemplification of the present invention.

XX Antisense compound useful for diagnosis, treatment and prevention of
XX disease associated with ELK-1 expression.
XX Claim 3; Col 38; 31pp; English.
XX Sequences AAZ06571-206607 are antisense polynucleotides targeted to a
XX nucleic acid molecule encoding human ELK-1 (also known as p62TCF). ELK-1
XX is a member of the ternary complex factor subfamily of Ets-domain
XX transcription factor proteins. The polynucleotides inhibit the expression
XX of human ELK-1, and this sequence targets the coding region of the ELK-1
XX RNA. Sequences AAZ06571-206607 all cause at least 30% inhibition of ELK-1
XX expression. The antisense sequences can be used to inhibit the expression
XX of human ELK-1 in human cells or tissues in vitro. ELK-1 uses a bipartite
XX recognition mechanism mediated by both protein-DNA and protein-protein
XX interactions to regulate genes by direct and indirect DNA binding and has
XX been shown to control various signal transduction pathways and other cell
XX functions including apoptosis. This means that antisense compounds
XX inhibiting expression of ELK-1 can be used to treat diseases associated
XX with its expression in animals, particularly humans and to prevent or
XX delay infection, inflammation or tumour formation. The compounds can also
XX be used for diagnosis, as research reagents and in kits

PT	Detecting microsatellite markers in the human genome comprising the use		
PT	of a polynucleotide primer, useful for detecting trinucleotide repeat		
PT	expansion mutations causing neurological disorders.		
XX	XX		
PS	Claim 6; Page 28; 32pp; English.		
XX	XX		
CC	The present invention describes a polynucleotide (N1) for detecting a		
CC	microsatellite marker in the human genome, where N1 is complementary to		
CC	contiguous nucleotides within 500 nucleotides of a trinucleotide repeat.		
CC	The microsatellite marker is selected from P12A7, P12E1, P32B10, P32D9,		
CC	P32H12, P42A5, P42F11, P55G12, P62D12, P72D4, P95B10, CCG43, CCG82,		
CC	CCG98, CCGFB48, CCGFB60, CCGFB64 and CCGFB84. AAA53033 to AAA53068		
CC	represent specifically claimed PCR primers for amplifying the		
CC	microsatellite markers. Also described are: (1) a method (M1) of		
CC	determining a change in the number of trinucleotide repeats in a		
CC	microsatellite marker comprising: (a) hybridising N1 to nucleic acid from		
CC	a patient sample; and (b) determining the size of the hybridised		
CC	polynucleotide where an increase in its size relative to N1 hybridised to		
CC	a normal sample indicates a change in the number of trinucleotide repeats		
CC	; and (2) a method (M2) for determining a change in number of		
CC	trinucleotide repeats in a microsatellite marker comprising: (a)		
CC	amplifying a microsatellite marker using N1 as the primer and a template		
CC	comprising a nucleic acid sample of a patient; and (b) determining the		
CC	size of the amplified microsatellite marker relative to the size of a		
CC	marker amplified using a nucleic acid sample from a normal human. N1, M1,		
CC	and M2 are useful for detecting the presence of trinucleotide repeat		
CC	expansion mutations causing diseases such as neurological disorders e.g.		
CC	dentatorubal pallidoluysian atrophy (DRPLA), spinocerebellar ataxia type		
CC	2, 3 and 4, autism, schizophrenia and bipolar affective disorder.		
CC	AAA53069 to AAA53076 represent PCR primers used in an example from the		
CC	present invention

XX An antisense compound targeted to a nucleic acid molecule encoding a
PT member of the human Rho family of small GTP binding proteins useful for
PT treating e.g. cancer and ischemia.
XX Example 16; Page 73; 156pp; English.
XX This invention relates to an antisense compound targeted to a nucleic
CC acid molecule encoding a member of the human Rho family of small GTP
CC binding proteins, where the antisense compound inhibits the expression of
CC the member of the human Rho family. The invention includes antisense
CC oligonucleotides AAF94580 - AAF94637 which target a RhoA nucleotide
CC sequence, AAF94645 - AAF94684 which target a RhoB nucleotide sequence,
CC AAF94725 which target a RhoC nucleotide sequence, AAF94727 -
CC AAF94766 which target RhoG nucleotide sequence, AAF94769 - AAF94790 which
CC target a Rac 1 nucleotide sequence and AAF94795 - AAF94809 which target
CC cdc42 nucleotide sequence. The antisense compound is useful for treating
CC hyperproliferative conditions, especially cancer, abnormal wound healing
CC or clotting conditions and ischemia/reperfusion or reoxygenation injury.
CC The compound may also be used to diagnose the above conditions

XX Determining polynucleotide expression, useful for expressing profiling or
PT detecting single nucleotide polymorphisms, comprises hybridizing digested
PT cDNA to a capture probe coupled to a solid particle under stringent
PT conditions.
XX Claim 34; Page 29; 63pp; English.

XX The present invention relates to a method of determining polynucleotide
CC expression, which comprises hybridising digested cDNA to a capture probe
CC coupled to a solid particle under stringent conditions, where the capture
CC probe is specific for the target polynucleotide and the particle
CC identifies the capture probe. The method is useful for expression
CC profiling, where the presence and/or the amount of a target
CC polynucleotide is simultaneously determined, for diagnosing a disease,
CC condition, disorder, or predisposition associated with a change in
CC expression patterns, in determining the developmental or physiological
CC state of a cell or tissue, for detecting SNPs, which may be used to
CC screen individuals for a genetic predisposition to a disease, condition,
CC or disorder, and in marker assisted selection. The present sequence is a
CC hybridisation tag described in the exemplification of the invention

XX Detecting/differentially detecting Mycobacterium strain in sample, by
PT reacting non-tuberculosis Mycobacterium species-specific upstream p34
PT gene region probe with sample and detecting duplexes having the probe.
XX Example 2; Page 29; 92pp; English.
XX The present invention relates to methods for differentiating and
CC detecting between Mycobacterium strains in a sample based on species-
CC specific upstream p34 gene region (us-p34) sequences. Also provided are
CC new us-p34 sequences, primers and probes. The invention also relates to
CC methods for detecting and differentiating between Pseudomonas strains. A
CC Mycobacterium species-specific us-p34 nucleotide probe or primer is
CC useful for producing a biochip or a micro-array for detecting M. avium-

CC complex (MAC-complex) Mycobacterium species in a sample, and detecting
 CC mycobacteria other than M. tuberculosis-complex (TUB) (MOTT)
 CC Mycobacterium in a sample. A Mycobacterium us-p34 nucleotide primer is
 CC useful for detecting new us-p34 sequences in a sample. The method of the
 CC invention identifies in a single assay, a wide range of mycobacterial
 CC species that include members of the TUB and non-tuberculous mycobacteria
 CC (NTM). The present sequence represents a control probe used in the
 CC examples of the present invention

 PT Detecting activity of enzymes that alter or cut nucleic acid, useful
 PT particularly for cytotoxic ribosome-inactivating proteins, from cleavage
 PT of fluorescent substrate.
 XX
 PS Example 1; Page 13; 32pp; German.
 XX
 CC The invention relates to detecting an enzymatically active substance (I)
 CC that causes sequence-specific depurination or depyrimidination of a
 CC nucleic acid (NA) without strand breakage or has sequence-specific
 CC endonuclease activity. The test sample is contacted with a substrate (II)
 CC that contains 3 NA segments: A and C that are complementary and hybridise
 CC under physiological conditions, forming a hairpin structure and an
 CC intermediate segment B, containing a recognition motif for the activity
 CC being determined. (II), also includes a fluorophore/quencher (F/Q) pair
 CC with one component linked to A and the other to C, so that when these
 CC segments are hybridised, F and Q are sufficiently close to each other for
 CC quenching to occur. Where (I) is being detected, the sample is also
 CC contacted with an agent (III) that cuts B specifically at the site where
 CC loss of a base has occurred. Any light emitted from F is then detected
 CC specifically. The method is especially used to determine activity of
 CC compounds with N-glycosidase activity, particularly ribosome-inactivating
 CC proteins (specifically mistletoe lectin) and restriction enzymes,
 CC particularly to detect loss of activity during storage but also to
 CC identify new, potentially therapeutic, enzymes. Some (I) are known as

CC cytotoxic agents, e.g. where coupled to monoclonal antibodies or
 CC cytokines. The present sequence is that of an oligonucleotide used to
 CC exemplify examples of the invention

Producing a recombinant polypeptide of interest comprises providing a
 transformed eukaryotic host cell and a serum-free culture medium and
 culturing the transformed eukaryotic host cell in the culture medium.

Example 1; Page 27; 54pp; English.

XX The present invention relates to a method of producing a recombinant
 CC polypeptide of interest, which comprises using a cost effective medium
 CC that does not contain serum or any functional (and/or recombinant) full-
 CC length protein. The medium comprises water, plant-derived peptone,
 CC osmolality regulator, buffer, energy source, amino acids, lipid source or
 CC precursor, source of iron, non-ferrous metal ions and one or more
 CC vitamins and cofactors. An example of a protein of interest is human
 CC erythropoietin (EPO). The method is useful for producing recombinant
 CC proteins of interest. The present sequence is an oligonucleotide used in
 CC the exemplification of the invention

XX PT Detecting and differentiating between hematopoietic cell proliferative
XX PT disorders, comprises contacting a target nucleic acid with a reagent that
XX PT distinguishes between methylated and non-methylated CpG dinucleotides.
XX
XX PS Claim 15; Page 69; 117pp; English.
XX
XX CC The present invention describes a method for detecting and
XX CC differentiating between haematopoietic cell proliferative disorders
XX CC associated with at least 1 gene and/or their regulatory regions in a
XX CC subject. The method comprises contacting a target nucleic acid in a
XX CC biological sample obtained from the subject with at least 1 reagent,
XX CC which distinguishes between methylated and non-methylated CpG
XX CC dinucleotides within the target nucleic acid. ABZ09861 to ABZ11118
XX CC represent specifically claimed nucleotide sequences from the present
XX CC invention. Oligonucleotides from the present invention can be used: for
XX CC differentiating healthy haematopoietic cells and proliferative
XX CC disorder haematopoietic cells; for differentiating between acute
XX CC lymphocytic leukaemia and acute myelogenous leukaemia; as probes for
XX CC determining the cytosine methylation state and/or single nucleotide
XX CC polymorphisms (SNPs) of haematopoietic cell proliferation disorder
XX CC related sequences and their complements; and as primers for the
XX CC amplification of haematopoietic cell proliferation disorder related DNA
XX CC sequences. The nucleotide sequences from the present invention can also
XX CC be used for detecting a predisposition to, differentiation between
XX CC subclasses, diagnosis, prognosis, treatment and/or monitoring of
XX CC haematopoietic cell proliferative disorders. The present method enables a
XX CC highly specific classification of haematopoietic cell proliferative
XX CC disorders allowing for improved and informed treatment of patients

```

XX The present invention relates to a method of producing a polypeptide of
CC interest, which involves culturing a hybridoma or transformed host cell
CC in a culture medium for mammalian cell culture, where the medium
CC comprises water, buffer, energy source, amino acids, lipid source,
CC precursor, or iron source, non-ferrous metal ions, inorganic salts,
CC vitamins and cofactors, and is free from each of a plant-derived or
CC animal-derived peptone. An example protein which may be produced using
CC the method is human erythropoietin (EPO). The method is useful for
CC producing a polypeptide of interest chosen from human growth hormone,
CC human monoclonal antibodies, preferably of subclasses IgG, IgM and IgA,
CC and monoclonal human/mouse chimeric antibodies, where the transformed
CC host cell comprises at least two polynucleotide vectors that encode
CC different proteins of interest and where the different proteins are
CC different parts of an antibody, particularly the light and heavy chains
CC of an antibody. The present sequence is an oligonucleotide used in the
CC exemplification of the invention

DR Detecting and differentiating between colon cell proliferative disorders
PT associated with a gene or its regulatory regions comprises contacting a
PT target nucleic acid in a biological sample obtained from the subject with
a reagent.

PS Claim 39; SEQ ID NO 70; 74pp; English.

XX The invention relates to a novel method for detecting and differentiating
CC between colon cell proliferative disorders associated with at least one
CC gene or its regulatory regions. The method comprises contacting a target
CC nucleic acid in a biological sample obtained from the subject with at
CC least one reagent or a series of reagents, where the reagent or series of
CC reagents, distinguishes between methylated and non methylated CpG
CC dinucleotides within the target nucleic acid. The molecules of the
CC invention demonstrate cytosatic activity whilst the method may useful
CC for detecting and differentiating between colon cell proliferative
CC disorders, including cancers such as colon adenoma and colon carcinoma.
CC The PNA (peptide nucleic acid)-oligomers are useful as probes for
CC determining cytosine methylation state or single nucleotide
CC polymorphisms. The current sequence is that of the oligonucleotide of the
CC invention which was used to analyse the CpG positions within the genomic
CC DNA regions. This sequence is not shown within the specification but is
CC taken from Wipoweb.

XX
XX WPI; 2003-755122/71.
XX
XX New secreted and transmembrane PRO polypeptides useful for treating
XX cancers, kidney disorders, Crohn's disease, diabetes mellitus, hyper- or
XX hypo-insulinemia, sports injuries and arthritis.
XX
XX Example 74; SEQ ID NO 256; 557pp; English.
XX
XX The invention relates to an isolated PRO polypeptide (secreted or
XX transmembrane protein) having at least 80% amino acid sequence identity
XX to an amino acid sequence chosen from 123 fully defined sequences as
XX given in the specification (including their extracellular domains either
XX or without their associated signal peptides. Also include are the
XX nucleotide (NA) sequences encoding PRO, a vector comprising the PRO NA, a
XX host cell comprising the vector, producing PRO, a chimaeric molecule
XX comprising PRO fused to a heterologous amino acid sequence, and an anti-
XX PRO antibody. Pro is useful as molecular weight markers for protein
XX electrophoresis and also for chromosome identification. PRO is also
```

CC useful for tissue typing. PRO and PRO NA are useful as hybridisation
 CC probes for a cDNA library to isolate the full-length PRO cDNA. PRO NA is
 CC useful for generating transgenic animals or knock-out animals which are
 CC useful in development and screening useful reagents. PRO NA is also
 CC useful in gene therapy. PRO1244, PRO1286 and PRO1303 polypeptides are
 CC useful for treating cancerous tumours. PRO1250, PRO1418 and PRO1410
 CC polypeptides are useful for suppressing immune response. PRO1246
 CC polypeptide is useful for treating cardiac insufficiency disorders.
 CC PRO1246 polypeptide is also useful for treating tumours. PRO1246 and
 CC PRO1561 polypeptide are useful for stimulating calcium flux in human
 CC umbilical vein endothelial cells. PRO1265, PRO1250 and PRO1474
 CC polypeptides are useful for treating bone and/or cartilage disorders
 CC (e.g. arthritis) and wound healing. PRO1130, PRO1275 and PRO1418
 CC polypeptides are useful for treating diabetes in skeletal muscle cells
 CC and obesity. PRO1265, PRO1444 and PRO1382 polypeptides are useful for
 CC treating Berger disease or other nephropathies associated with Schonlein-
 CC Henoch purpura, coeliac disease, dermatitis, herpetiformis or Crohn's
 CC disease. PRO1478, PRO1265, PRO1412, PRO1279, PRO1304, PRO1306, PRO1418,
 CC PRO1410 and PRO1575 are useful in treating thalassaemias. The present
 CC sequence is a PCR primer used to isolate a cDNA encoding a PRO protein of
 CC the invention.

XX PT Novel isolated PRO polypeptide useful for tissue typing, modulating
PT biological activity of cell, as molecular weight markers in protein
PT electrophoresis, for treating arthritis, tumor.
XX XX Example 74; SEQ ID NO 256; 549pp; English.
CC CC The invention relates to an isolated PRO polypeptide (secreted or
transmembrane protein) having at least 80% amino acid sequence identity

XX Novel isolated PRO polypeptide useful for tissue typing, modulating
XX biological activity of cell, as molecular weight markers in protein
XX electrophoresis, for treating arthritis, tumor.
XX Example 74; SEQ ID NO 256; 550pp; English.

CC The invention relates to an isolated PRO polypeptide (secreted or
CC transmembrane protein) having at least 80% amino acid sequence identity

XX New isolated PRO polypeptide such as PRO1560, PRO444, PRO1018, PRO1773,
PT PRO1244, PRO1246, useful for treating cancerous tumors, cardiac
PT insufficiency disorders, wound healing, Crohn's disease, celiac disease.
XX Example 74; SEQ ID NO 256; 555pp; English.
PS The invention relates to an isolated PRO polypeptide (secreted or
CC transmembrane protein) having at least 80% amino acid sequence identity
Query Match 4.2%; Score 12.2; DB 1; Length 18;

XX Identifying class I or II Human Leukocyte Antigen genotypes using
XX hybridization and amplification assays.
XX Claim 7; SEQ ID NO 145; 66pp; English.
XX The invention relates to a method of identifying a class I or II Human
XX Leukocyte Antigen (HLA) genotype of a subject using hybridisation and
XX amplification assay. The method is used for determining the HLA genotype
XX of a subject. The present sequence represents a HLA class I allele
XX specific primer.

XX
XX New isolated PRO polypeptide useful for tissue typing, modulating
PT biological activity of cell, as molecular weight markers in protein
PT electrophoresis, for treating arthritis and tumors.
XX
XX Example 74; SEQ ID NO 256; 555pp; English.
XX
XX The invention relates to an isolated PRO polypeptide (secreted or
CC transmembrane protein) having at least 80% amino acid sequence identity
Query Match 4.2%; Score 12.2; DB 1; Length 18;

 DR Determining a predisposition for or the occurrence of neurodegenerative
 PT disease, e.g. Alzheimer's disease by detecting in a target nucleic acid
 PT the presence or absence of an allelic variant of one or more polymorphic
 PT regions.
 XX
 PS Example 3; Page 277; 848pp; English.
 XX
 CC The present invention relates to a method (M1) for determining a

CC predisposition for or the occurrence of neurodegenerative disease in a
 CC subject. The method comprises detecting in a target nucleic acid obtained
 CC from the subject the presence or absence of an allelic variant of one or
 CC more polymorphic regions of one or more genes selected from uPA
 CC (Urokinase plasminogen activator), SNCG (gamma-synuclein), IDE (insulin-
 CC degrading enzyme), KNSL1 (Kinesin-like protein 1), LIPA (lysosomal acid
 CC lyase), and TNFRSF6 (Tumour Necrosis Factor Receptor-SF6), where the
 CC presence of at least one of the allelic variant of one or more
 CC polymorphic regions is indicative of a predisposition for or the
 CC occurrence of neurodegenerative disease. The genes are all located on
 CC chromosome 10. M1 is useful for determining a predisposition for or the
 CC occurrence of, and for treating neurodegenerative disease, particularly
 CC Alzheimer's disease. The present sequence is a PCR primer, which was used
 CC in the method of the invention.

PT  New oligomers contg. modified bases - which form a triplex with G-C
PT  doublet in a DNA duplex, for treating and diagnosing HIV, hepatitis,
PT  herpes malignancy and inflammation.
XX
PS  Claim 12; Page 66; 77pp; English.
XX
CC  The synthetic oligomer is capable of forming a triplex at physiological
CC  pH with a purine rich target sequence by coupling into the major groove
CC  of the duplex. The specific target sequence of this oligomer is an HBV
CC  target duplex beginning at nucleotide 2605 contg. a purine-rich region

```

CC concentrated on one chain of the duplex. The oligomer, and others like it
 CC are useful in diagnosis and therapy of diseases characterised by specific
 CC DNA duplex targets, e.g. HIV, hepatitis, herpes, malignant tumours and
 CC inflammation. The triple helices form under mild conditions thus assays
 CC may be carried out without subjecting the test specimen to harsh
 CC conditions. Additional modifications, such as altered internucleotide
 CC linkages may also be incorporated, rendering the oligomer e.g. stable to
 CC nuclease activity. The oligomer is able to inhibit gene expression, as
 CC verified by in vitro systems. See also AAQ35452-25501 and AAQ30226-448.

XX PT Sequence specific inhibition of DNA synthesis - by triplex-forming
 oligonucleotide(s), for detection of oncogene mutation(s) and treatment
 of e.g. HSV, Hepatitis C and Papillomavirus infection.

XX PS Claim 18; Page 57; 78pp; English.

XX CC Specifically designed oligodeoxyribonucleotides form triplexes in single-
 or double-strand DNA at homopurine-homopyrimidine targets. These
 CC triplexes block in vitro DNA synthesis by all DNA polymerases studied,
 CC including Sequenase3, Tag, Vent, and Pol I. A similar phenomenon occurs
 CC when DNA polymerases are supplemented with accessory replication
 CC proteins, including SSB protein. Replication blockage is highly sequence-
 CC specific and even one or two point substitutions within either the target
 CC sequence or the oligonucleotide abolish the effect. Sequence-specific
 CC blocking of DNA replication in vivo is facilitated by the methods and
 CC compositions of the present invention. The present sequence is a triplex-
 CC forming oligonucleotide which targets the P gene (position 2670-2681) of
 XX hepatitis B virus

XX PT Assay of genetic sequences based on triplex formation from double
 stranded analyte - and hybrid of anchor and reporter sequences, with
 PT reporter released if triplex formation occurs, used e.g. to identify
 PT bacteria.

XX PS Disclosure; Col 19-20; 168pp; English.

XX CC The present sequence represents a polynucleotide that is able to form a
 CC triple helix with a double stranded sequence. Cytosine bases in the
 CC present can be replaced with 5-methylcytosine for increased triplex
 CC stability. The present sequence is used in the assay of the invention,
 CC where it can be part of the anchor DNA or reporter DNA sequence. The
 CC assay comprises adding a sample containing double-stranded DNA test
 CC sequences to an aqueous medium containing at least one complex of anchor
 CC DNA, attached to a solid support, and reporter DNA, where either a part
 CC of the anchor DNA or reporter DNA is designed to form a triple-strand
 CC structure with part of the test sequence. Triplex formation results in
 CC displacement of the reporter DNA which is detected as an indication of
 CC the presence of the DNA test sequence. The method is used to detect DNA
 CC sequences, particularly for identification of bacteria (by detecting
 CC genes for ribosomal RNA) in clinical samples, but also detection of
 CC oncogenes and Hepatitis B virus

 Ribozyme that cleaves specific MHC allele(s) - used to inhibit graft
 versus host reactions, to overcome blood incompatibility and to treat
 auto-immune disease.
 Claim 5; Fig 1; 76pp; German.
 AAV10915-V11123 are target sequences for a novel ribozyme which cleaves
 specific alleles from the major histocompatibility complex (MHC). This
 ribozyme contains a catalytic region and a hybridisation region which is
 complementary to all mRNA transcribed from vertebrate genes of a specific
 family of closely related MHC alleles or to mRNA from a single MHC
 allele, and is able to cleave such mRNA. The mRNA has a target region
 which in case is essentially conserved in all genes of the family but
 differs from genes of all other MHC alleles to such a degree that no
 cleavage of mRNA transcribed from these other alleles occurs. This allows
 the selective reduction or inhibition of expression of all genes of a
 family or of a single gene. This ribozyme can be used for permanent or
 transient suppression of expression of MHC alleles, in vivo or in vitro.
 Specific applications are to prevent guest vs. host or host vs. guest
 reactions, to prevent blood incompatibilities (partic. of the ABO, rhesus
 and Kell systems) and to treat autoimmune diseases such as juvenile
 diabetes and rheumatoid arthritis. The use of this ribozyme avoids the
 need for immunosuppressants in transplant patients. It provides very
 specific reduction of particular HLA molecules that cause incompatibility
 between donor and recipient. (Updated on 25-MAR-2003 to correct PA
 field.) (Updated on 25-MAR-2003 to correct PI field.)

 XX
 CC The present invention describes nucleic acid molecules which modulate the
 CC synthesis, expression and/or stability of a mRNA encoding 1 or more
 CC receptors of vascular endothelial growth factor (VEGF). A patient
 CC (preferably human) having a condition associated with the level of the
 CC fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing
 CC receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour
 CC angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be
 CC treated by administering the nucleic acid molecule or the expression
 CC vector to the patient. AAX67275 to AAX75752 represent specific examples
 CC of nucleic acid molecules from the present invention

 XX Claim 1; Page 85; 123pp; English.
 XX
 CC The present sequence represents the preferred target sequence of an
 CC enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves
 CC the Hepatitis C virus (HCV) RNA sequence at the base position given in
 CC the descriptor line. The HCV sequence was screened for optimal ribozyme
 CC target sites using a computer folding algorithm and regions of the mRNA
 CC which did not form secondary folding structures and contained potential
 CC ribozyme cleavage sites were identified. Ribozymes were synthesised to
 CC target these sites and their activities optimised by either varying the
 CC length of the binding arms or by modification to prevent degradation by
 CC nucleases. The ribozymes of the invention inhibit gene expression and/or
 CC viral replication, and are used to treat diseases associated with
 CC Hepatitis C virus (HCV) infection, e.g. cirrhosis, liver failure and
 CC hepatocellular carcinoma. The ribozymes may be used in combination with
 CC interferon to treat HCV infection, other infectious diseases, autoimmune
 CC diseases, and cancer

PT Novel genetic variants of Flavon Containing Monooxygenase 2 isogenes,

PT useful for improving efficiency and reliability in drug development for

PT treating developmental bone disorders.

XX PT

XX Claim 15; Page 16; 140pp; English.

PS Claim 15; Page 16; 140pp; English.

XX

CC The present invention relates to a new polynucleotide which comprises

CC flavin containing monooxygenase-2 (FMO2) isogenes. The invention is

CC useful in screening for drugs that are useful for treating drug toxicity.

CC The methods of the invention are useful for improving the efficiency and

CC reliability of several steps in the discovery and development of drugs

CC used by the pharmaceutical research scientist to validate FMO2 as a

CC candidate target for treating a specific condition or disease predicted

CC to be associated with FMO2 activity, e.g. drug toxicity, and in the

CC design of clinical trials for treating a specific condition of disease

CC associated with FMO2 activity. The methods are also useful for screening

CC compounds targeting FMO2. The nucleic acid of the invention is useful in

CC studying the expression and function of FMO2, and in expressing FMO2

CC protein for use in screening for candidate drugs to treat diseases

CC related to FMO2 activity. It is also useful in studying the effect of the

CC variation on the biological activity of FMO2 as well as on the binding

CC affinity of candidate drugs targeting FMO2 for the treatment of drug

CC toxicity. The invention is useful for studying the expression of FMO2

CC isogenes in vivo, for in vivo screening and testing of drugs targeted

CC against FMO2 protein, and for testing the efficacy of therapeutic agents

CC and compounds for treating drug toxicity in a biological system. The

CC present nucleic acid sequence represents an allele-specific

CC oligonucleotide (ASO) primer that was used in the methods of the

CC invention to detect polymorphisms in the human FMO2 gene located on

CC chromosome 1q

XX PT

XX Claim 16; Page 13; 90pp; English.

PS Claim 16; Page 13; 90pp; English.

XX

CC The invention relates to single nucleotide polymorphisms in the gene

CC encoding human aminolevulinate delta synthase 2 (ALAS2). A method for

CC haplotyping the ALAS2 gene in an individual comprises identifying the

CC nucleotide at one or more polymorphic sites and determining whether one

CC of the copies of the gene is defined by one of the ALAS2 haplotypes given

CC in the specification or whether both copies are defined by a haplotype

CC pair. This method is useful in genotyping, whereby all possible haplotype

CC pairs can be assigned to specific genotypes. An association between a

CC trait and a haplotype or haplotype pair of the ALAS2 gene can be

CC identified by comparing the frequency of the haplotype or haplotype pair

CC in a population exhibiting the trait with the frequency of the haplotype

CC or haplotype pair in a reference population, where a higher haplotype

CC frequency in the trait population indicates the trait is associated with

CC the haplotype or haplotype pair. ALAS2 and its corresponding DNA are used

CC for studying the expression and function of ALAS2, for use in screening

CC for candidate drugs to treat diseases related to ALAS2 activity, such as

CC X-linked sideroblastic anaemia and hypochromic anaemia. The sequences are

CC also useful for studying the effect of variation on the biological

CC activity of ALAS2 as well as on the binding affinity of candidate drugs

CC targeting ALAS2. Sequences ABK36963-ABK37027 represent allele-specific

CC oligonucleotide probes, sequencing primers and PCR primers used to detect

CC ALAS2 gene polymorphisms

PS Claim 15; Page 14; 73pp; English.

XX

CC The invention relates to single nucleotide polymorphisms in the gene

CC encoding the human v-fos FBJ murine osteosarcoma viral oncogene homologue

CC (FOS) polypeptide. A method for haplotyping the FOS gene in an individual

CC comprises identifying the nucleotide at one or more polymorphic sites and

CC determining whether one of the copies of the gene is defined by one of

CC the FOS haplotypes given in the specification or whether both copies are

CC defined by a haplotype pair. This method is useful in genotyping, whereby

CC all possible haplotype pairs can be assigned to specific genotypes. An

CC association between a trait and a haplotype or haplotype pair of the FOS

CC gene can be identified by comparing the frequency of the haplotype or

CC haplotype pair in a population exhibiting the trait with the frequency of

CC the haplotype or haplotype pair in a reference population, where a higher

CC haplotype frequency in the trait population indicates the trait is

CC associated with the haplotype or haplotype pair. FOS and its

CC corresponding DNA are used for studying the expression and function of

CC FOS, for use in screening for candidate drugs to treat diseases related

CC to FOS activity, such as developmental bone disorders and tumours. The

CC sequences are also useful for studying the effect of variation on the

CC biological activity of FOS as well as on the binding affinity of

CC candidate drugs targeting FOS. Sequences ABK81338-ABK81357 represent

CC allele-specific oligonucleotide sequencing primers used for detecting FOS

CC gene polymorphisms

PT New isolated polymorphic variant of human angiotensin receptor-like 1

PT (AGTRL1) gene useful for expressing AGTRL1 protein isoform to screen

PT drugs to treat AGTRL1 activity-related disease.

XX

PS Claim 16; Page 13; 71pp; English.

XX

CC The invention relates to single nucleotide polymorphisms in the gene

CC encoding the human angiotensin receptor-like 1 (AGTRL1) polypeptide. A

CC method for haplotyping the AGTRL1 gene in an individual comprises

CC identifying the nucleotide at one or more polymorphic sites and

CC determining whether one of the copies of the gene is defined by one of

CC the AGTRL1 haplotypes given in the specification or whether both copies

CC are defined by a haplotype pair. This method is useful in genotyping,

CC whereby all possible haplotype pairs can be assigned to specific

CC genotypes. An association between a trait and a haplotype or haplotype

CC pair of the AGTRL1 gene can be identified by comparing the frequency of

CC the haplotype or haplotype pair in a population exhibiting the trait with

CC the frequency of the haplotype or haplotype pair in a reference

CC population, where a higher haplotype frequency in the trait population

CC indicates the trait is associated with the haplotype or haplotype pair.

CC AGTRL1 and its corresponding DNA are used for studying the expression and

CC function of AGTRL1, for use in screening for candidate drugs to treat

CC diseases related to AGTRL1 activity, such as hypertension. The sequences

CC are also useful for studying the effect of variation on the biological

CC activity of AGTRL1 as well as on the binding affinity of candidate drugs

CC targeting AGTRL1. Sequences ABK16638-ABK16682 represent allele-specific

CC oligonucleotide probes, sequencing primers and PCR primers used to detect

CC AGTRL1 gene polymorphisms

PT Novel genetic variants of Duffy Blood group (FY) gene useful for

PT screening drugs to treat diseases e.g. malaria and inflammatory

PT disorders.

XX

PS Claim 15; Page 14; 98pp; English.

XX The present sequence is an allele-specific oligonucleotide primer that

CC was designed to detect a specific polymorphism in the human Duffy blood

CC group (FY) gene (see ABL57150). The primer is one of a set (see ABL57167-

CC 98) that can be used in a kit for haplotyping or genotyping the FY gene

CC of an individual. The primer has a 3' penultimate nucleotide that is

CC complementary to only one nucleotide of a particular single nucleotide

CC polymorphism, and acts as a primer for polymerase-mediated extension only

CC if the allele containing that nucleotide is present. The invention

CC provides novel genetic variants of the FY gene, and discloses various

CC genotypes, haplotypes and haplotype pairs that exist in the general

CC United States population. Compositions and methods for haplotyping and/or

CC genotyping the FY gene in an individual are also disclosed. The

CC polymorphism and haplotype data are useful for validating FY as a

CC candidate target for treating a condition or disease associated with FY

CC activity, such as malaria and inflammatory disorders

PT Genetic variants of Plasminogen activator, Urokinase (PLAU) isogenes, for

PT useful for improving efficiency and reliability in drug development for

PT treating thrombolytic disorders and cancer.

XX

PS Claim 14; Page 14; 92pp; English.

XX

CC The invention relates to a polynucleotide comprising a first nucleotide

CC sequence (NS1) comprising a PLAU (plasminogen activator, urokinase, a

CC serine protease) isogene selected from isogenes 1-9 and 11-20 given in

CC the specification, where each isogene comprises the regions of the PLAU

CC gene or cDNA and is further defined by the corresponding sequence of

CC polymorphisms (defining single nucleotide polymorphisms, SNP). Also

CC included are methods of haplotyping/genotyping (and predicting the

CC haplotype/genotype of the PLAU gene of an individual, identifying an

CC association between a trait and at least one haplotype or haplotype pair

CC of the PLAU gene, an isolated oligonucleotide for detecting a

CC polymorphism in the PLAU gene, a recombinant non-human organism

CC transformed or transfected with the gene or cDNA, fragments of the

CC polynucleotides of at least 10 base pairs encompassing a polymorphic

CC site, an isolated polymorphic variant PLAU protein or fragment, an

CC isolated monoclonal antibody specific for PLAU, a computer system for

CC storing and analysing polymorphism data for the PLAU gene and a genome

CC anthology for the PLAU gene. PLAU is useful in screening for drugs

CC targeting PLAU that are useful for treating thrombolytic disorders and

CC cancers. The methods are useful for improving the efficiency and

CC reliability of the discovery and development of drugs for treating

CC diseases associated with PLAU activity, in validating PLAU as a drug

CC target and in the design of clinical trials for treating a specific

CC condition of disease associated with PLAU activity. The antibody is

CC useful in diagnostic, prognostic and therapeutic methods. PLAU

CC polynucleotides are useful in studying the expression and function of

CC PLAU, and in expressing PLAU protein for use in screening for candidate

CC drugs to treat diseases related to PLAU activity. The gene for PLAU is

CC located on chromosome 10q24-qter. The present sequence is an allele

CC specific primer used to amplify PLAU polynucleotides with a specific

CC polymorphism

PT New genetic variants of human arylalkylamine N-acetyltransferase (AANAT)

PT gene for studying expression, function of the gene and expressing AANAT

PT protein for use in screening for drugs to treat disorders of pineal

PT gland.

XX

PS Claim 16; Page 13; 67pp; English.

XX

CC The patent discloses novel genetic variants of the arylalkylamine N-
 CC acetyltransferase (AANAT) gene. The invention also relates to
 CC compositions and methods for haplotyping and/or genotyping the AANAT
 CC gene. Polymorphic variants of AANAT protein are useful for screening for
 CC drugs targeting the polypeptide. AANAT polynucleotides are useful for
 CC studying the expression and function of AANAT and for expressing AANAT
 CC protein for use in screening for candidate drugs to treat diseases
 CC related to AANAT activity. The methods are used to develop diagnostic
 CC tests and therapeutic treatment for disorders of pineal gland that derive
 CC from defects in melatonin synthesis. It is useful for determining whether
 CC an individual has one of the haplotypes 1-4 or the haplotype pairs. The
 CC haplotyping method is useful to validate AANAT as a candidate target for
 CC treating a specific condition or disease predicted to be associated with
 CC AANAT activity. AANAT sequences of the invention are also used in gene
 CC therapy and antisense therapy. The present DNA sequence is an allele
 CC specific oligonucleotide (ASO) primer which is used for detecting human
 CC AANAT gene polymorphisms

XX New ribozymes targeting RNA derived from hepatitis C virus inhibit viral
 PT replication and are useful to treat hepatitis C virus infections and
 PT cirrhosis, liver failure or hepatocellular carcinoma.

XX Claim 1; Page 51; 80pp; English.

XX The present invention relates to enzymatic nucleic acids which

CC specifically cleave RNA derived from Hepatitis C virus (HCV). The
 CC enzymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin
 CC (HP) motif where the binding arms comprise sequences complementary to one
 CC of the substrate sequences defined in the specification. The HCV
 CC ribozymes are useful for modulating the expression and/or replication of
 CC HCV. They can be used to treat cirrhosis, liver failure and/or
 CC hepatocellular carcinoma. The HCV ribozymes are also useful for treating
 CC a condition associated with HCV infection in conjunction with one or more
 CC other drug therapies, particularly type I interferon, especially
 CC interferon alpha, beta or gamma or consensus interferon. The present
 CC sequence represents a substrate for a HCV hammerhead (HH) ribozyme. Note:
 CC Some of the sequence data for this patent did not form part of the
 CC printed specification. The complete sequence data for this patent was
 CC obtained in electronic format directly from the USPTO web site at
 CC seqdata.uspto.gov/patpblDentry.html

XX Determining whether an individual is predisposed to susceptibility to low
 PT bone mineral density (BMD) and/or bone damage, involves identifying
 PT polymorphisms in associated genes.

XX Example 8; Page 238; 246pp; English.

XX The present invention describes a method of determining whether an
 CC individual is predisposed to susceptibility to low bone mineral density
 CC (BMD) and/or bone damage comprising identifying whether the individual
 CC has at least one polymorphism in a polynucleotide encoding a protein,
 CC where the polynucleotide is one of 81,200-500 nucleotide sequences (S1,
 CC see ADC98235 to ADC98315). An agent identified in an method from the
 CC present invention which can be used for the prevention or treatment of a
 CC disease resulting in susceptibility to low BMD and/or bone damage is

CC useful in the manufacture of a medicament for use in modulating the
 CC susceptibility to low BMD and/or bone damage. The disease associated with
 CC low BMD and/or bone damage is osteoporosis. The present PCR primer
 CC sequence is used in the exemplification of the present invention.

XX Novel method for typing HLA DQB1 alleles - for tissue typing, determining
 PT identity, and for studying disease susceptibility.
 XX Disclosure; Page 30; 37pp; English.

XX The sequences given in AAQ26461-81 are probes which were used within the
 CC scope of the invention to type class II HLA DQB1 alleles. These probes
 CC were used to screen sequences amplified from the DQB1 gene second exon
 CC sequence. This method could be used to identify new DQB1 alleles. This
 CC method provides a simple, rapid and precise system for DQB1 typing,
 CC including those alleles which cannot be distinguished by serological
 CC methods. The presence or absence of a particular HLA DQB1 allele serves
 CC as an indicator of susceptibility to insulin-dependent diabetes mellitus
 CC (IDDM). Accurate DQ typing is particularly important in the field of
 CC organ transplantation and in the study of the molecular basis of disease
 CC susceptibility. Moreover, samples from unusual sources, eg. ancient DNA
 CC or forensic samples, can be typed, even when the DNA sample is degraded
 CC or only present in an small amount. (Updated on 25-MAR-2003 to correct PN
 CC field.)

 PT Novel human UDP-glucuronosyltransferase sequence, polymorphisms for
 PT genotyping individuals to predict rate of metabolism of substrates and
 PT for identifying potential drug interactions.
 XX
 PS Example 1; Page 18; 72pp; English.
 XX
 CC This sequence represents a primer used to sequence polymorphic fragments
 CC of the human UDP-glucuronosyltransferase 2B4 (UGT2B4) gene. UDP-
 CC glucuronosyltransferases (UGTs) are a family of enzymes that catalyse the
 CC glucuronic acid conjugation of a wide range of endogenous and exogenous
 CC substrates. The UGT2B gene subfamily encode steroid metabolizing isoforms
 CC in the liver. Alteration of the expression or function of UGTs may effect
 CC drug metabolism. The invention relates to non-chromosomal nucleic acid
 CC molecules, which comprise human UGT2B sequence polymorphisms (see
 CC AAZ95051-295110). Probes which detect the UGT2B locus polymorphisms can
 CC be used to detect altered UGT2B metabolism of a substrate in an
 CC individual. The nucleic acid molecules comprising a human UGT2B sequence
 CC polymorphism can be used in screening assays for genotyping individuals,
 CC also to predict their rate of metabolism of UGT2B substrate, potential
 CC drug-drug interactions and adverse side effects. The polymorphisms can be
 CC used as single nucleotide polymorphisms (SNPs) for detecting genetic
 CC linkage related to phenotypic variation in activity or expression of
 CC UGT2B protein. The polymorphism containing nucleic acid molecules may
 CC also be used for generating genetically modified non-human animals and
 CC for obtaining site specific gene modification in cell lines

 PT fingerprinting and determining allele frequency of SNPs.
 PT
 XX Disclosure; Page 60; 11pp; English.
 PS
 XX A method has been developed for detecting the presence or absence of a
 CC single nucleotide polymorphism (SNP) allele in a genomic sample. The
 CC method comprises preparing a reduced complexity genome (RCG) from the
 CC genomic sample and analysing the RCG for the presence or absence of a SNP
 CC allele. The method can be used to characterise a tumour, to generate a
 CC genomic pattern for an individual genome or to generate a genomic
 CC classification code for a genome. The method can be used to assess
 CC whether a subject is at risk for developing a disease or to identify a
 CC set of SNP alleles associated with a disease. The method can also be used
 CC to perform linkage analysis. AAA35944 to AAA35947 represent sequences
 CC used in the exemplification of the present invention. AAA35948 to
 CC AAA36632 represent nucleotide sequences containing SNPs

 XX The invention relates to an oligonucleotide for targeted alteration of a
 CC genetic sequence, which comprises a single-stranded oligonucleotide
 CC having a DNA domain. The DNA domain has at least one mismatch with
 CC respect to the genetic sequence to be altered and further comprises
 CC chemical modifications of the oligonucleotide. The chemical modifications
 CC consist of o-methyl modification, an LNA modification, two or more
 CC phosphorothioate linkages on a terminus, or a combination of any two or
 CC more of these modifications. The oligonucleotides are useful for
 CC directing repair or alteration of plant genetic information. The
 CC oligonucleotides are particularly useful for creating plants with desired
 CC phenotypes, e.g. environmental or abiotic stress tolerance, improved
 CC nutritional value (e.g. altering amino acid content of plants or
 CC conferring amino acid over production), herbicide resistance (e.g.
 CC glyphosate resistance, imidazolinone and sulphonylurea herbicide
 CC resistance, porphyrin herbicide resistance or triazine resistance),
 CC disease resistance, modified oil production, modified starch production
 CC (e.g. increased starch or production of waxy starch), altered floral
 CC morphology (e.g. male-sterile plants) or modified fatty acid content
 CC (e.g. reduced palmitate, increased stearate or reduced linolenic acid).
 CC The oligonucleotides are also useful for producing albino mutants for the
 CC analysis of photosynthetic processes. This sequence represents a genome
 CC altering oligonucleotide of the invention

XX CC

The invention relates to an oligonucleotide for targeted alteration of a

CC genetic sequence, which comprises a single-stranded oligonucleotide

CC having a DNA domain. The DNA domain has at least one mismatch with

CC respect to the genetic sequence to be altered and further comprises

CC chemical modifications of the oligonucleotide. The chemical modifications

CC consist of o-methyl modification, an LNA modification, two or more

CC phosphorothioate linkages on a terminus, or a combination of any two or

CC more of these modifications. The oligonucleotides are useful for

CC directing repair or alteration of plant genetic information. The

CC oligonucleotides are particularly useful for creating plants with desired

CC phenotypes, e.g. environmental or abiotic stress tolerance, improved

CC nutritional value (e.g. altering amino acid content of plants or

CC conferring amino acid over production), herbicide resistance (e.g.

CC glyphosate resistance, imidazolinone and sulphonylurea herbicide
 CC resistance, porphyric herbicide resistance or triazine resistance),
 CC disease resistance, modified oil production, modified starch production
 CC (e.g. increased starch or production of waxy starch), altered floral
 CC morphology (e.g. male-sterile plants) or modified fatty acid content
 CC (e.g. reduced palmitate, increased stearate or reduced linolenic acid).
 CC The oligonucleotides are also useful for producing albino mutants for the
 CC analysis of photosynthetic processes. This sequence represents a genome
 CC altering oligonucleotide of the invention

 PT with tumors and cell degeneration, also related polypeptides, antibodies
 PT and transfected cells.

XX Disclosure; Page 114; 720pp; French.

XX The invention relates to a novel isolated 17 mer nucleic acid sequence;
 CC given in the specification, a sequence containing at least 15 consecutive
 CC nucleotides from the 17 mer sequence, a sequence with, after optimal
 CC alignment, at least 80 % identity to the 17 mer sequence, a sequence that
 CC hybridizes to them under highly stringent conditions, or the complement
 CC of any of them, or the corresponding RNA. The novel isolated nucleic
 CC acids of the invention are useful as probes and primers for detecting,
 CC identifying, quantifying and/or amplifying a nucleic acid, e.g. as one
 CC component of a gene chip, in vitro as (anti)sense reagents, and for
 CC production of recombinant polypeptides. Any of the nucleic acids,
 CC polypeptides, vectors containing the nucleic acids, cells containing the
 CC vector or antibodies directed against the polypeptides are useful for
 CC preparation of pharmaceuticals for prevention and/or treatment of viral
 CC diseases that are characterised by development of tumours or cell
 CC degeneration, specifically cancer but also Alzheimer's disease and

CC schizophrenia. Analysis of the expression of the 17 mer nucleic acids in
 CC patient samples is useful for diagnosis and/or prognosis of these
 CC diseases. The polypeptides can also be used to generate antibodies, and
 CC both the polypeptide and antibodies are useful as components of protein
 CC chips. The nucleic acid sequences of the invention can be used in gene
 CC therapy. This polynucleotide sequence represents a tumour suppression
 CC related human fukutin oligonucleotide of the invention

Novel enzymatic nucleic acid molecules which down regulates expression of
 PT a sequence encoding a subunit of nuclear factor kappa B useful for
 PT treating cancer, inflammatory disorders and autoimmune diseases.
 XX
 PS Claim 3; Page 35; 72pp; English.
 XX

The invention describes an enzymatic nucleic acid molecule (I) which down
 CC regulates expression of a sequence encoding a subunit of nuclear factor
 CC kappa B (NFKB), where (I) is an inozyme, zinzyme, G-cleaver or amberzyme
 CC configuration. The enzymatic nucleic acid molecule is adapted to treat
 CC cancer and is useful for down-regulating REL-A activity in a cell, for
 CC treating a patient having a condition associated with the level of REL-A.
 CC (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in

CC the presence of a divalent cation, especially Mg²⁺. The enzymatic and
 CC antisense nucleic acid molecules are useful for treating breast, lung,
 CC prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic,
 CC cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or
 CC multidrug resistant cancer. The method involves use of other drug
 CC therapies such as monoclonal antibodies, REL-A-specific inhibitors or
 CC chemotherapies including paclitaxel, docetaxel, cisplatin, methotrexate,
 CC cyclophosphamide, doxorubicin, fluorouracil carboplatin, edatrexate,
 CC gemcitabine or radiation therapy. The enzymatic and antisense nucleic
 CC acid molecules are also useful for treating inflammatory disease such as
 CC rheumatoid arthritis, restenosis, asthma, Crohn's disease, diabetes,
 CC obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft
 CC rejection, gene therapy applications, ischaemia/reperfusion injury
 CC (central nervous system (CNS) and myocardial), glomerulonephritis
 CC sepsis, allergic airway inflammation, inflammatory bowel disease or
 CC infection. This sequence represents the substrate of a novel enzymatic
 CC nucleic acid molecule

 XX
 XX Enzymatic nucleic acid molecules having a hammer-head motif - used for
 PT the treatment of arthritis, induction of graft tolerance or treatment of
 PT auto-immune diseases.
 XX
 XX Example 1; Page 164; 307pp; English.
 XX
 XX The present invention describes a novel enzymatic nucleic acid (ENA)
 CC having a hammerhead motif (HM) comprising: (i) at least 5 ribose residues
 CC ; (ii) a 2'-C-allyl modification at position 4 of the ENA; (iii) at least
 CC ten 2'-O-methyl modifications; and (iv) a 3'-end modification. The ENA's
 CC can inhibit collagenase and stromelysin production in the synovial
 CC membrane of joints for the treatment or prevention of arthritis,
 CC particularly osteoarthritis or rheumatoid arthritis. The ENA's can also
 CC be used to treat antigen presenting cells of a donor to induce tolerance
 CC in a recipient to an alloantigen of a donor. They can also be used for
 CC enhancing graft tolerance or for treating autoimmune disease, and for
 CC treating allergies and other inflammatory conditions. The ENA's can also
 CC be used in diagnosis. Ribozyme therapy impacts on the expression of
 CC stromelysin without introducing the non-specific effects upon gene
 CC expression which accompany treatment with retinoids and dexamethasone.
 CC The concentration of ribozyme required to affect a therapeutic treatment
 CC is lower than that required of antisense molecules, and is highly
 CC specific. The present sequence is used in the exemplification of the
 CC present invention

 XX Example 13; Page 64; 156pp; English.
 PS
 XX
 XX This invention relates to an antisense compound targeted to a nucleic
 CC acid molecule encoding a member of the human Rho family of small GTP
 CC binding proteins, where the antisense compound inhibits the expression of
 CC the member of the human Rho family. The invention includes antisense
 CC oligonucleotides AAF94580 - AAF94637 which target a RhoA nucleotide
 CC sequence, AAF94645 - AAF94684 which target a RhoB nucleotide sequence,
 CC AAF94686 - AAF94725 which target a RhoC nucleotide sequence, AAF94727 -
 CC AAF94766 which target RhoG nucleotide sequence, AAF94769 - AAF94790 which
 CC target a Rac 1 nucleotide sequence and AAF94795 - AAF94809 which target
 CC cdc42 nucleotide sequence. The antisense compound is useful for treating

CC hyperproliferative conditions, especially cancer, abnormal wound healing
 CC or clotting conditions and ischaemia/reperfusion or reoxygenation injury.
 CC The compound may also be used to diagnose the above conditions

 PT New polynucleotides which encode polypeptides involved in olfactory
 PT sensation for identifying olfactory agonists and antagonists.
 XX
 PS Example 1; Page 43; 1857pp; English.
 XX
 CC The present sequence is provided in a specification relating to isolated
 CC polynucleotides which encode polypeptides involved in olfactory
 CC sensation. The polynucleotides can be used in screening for olfactory
 CC agonists and antagonists. The methods allow for the determination of
 CC primary scents and the identification of the odour receptors used to
 CC detect these primary scents. The methods also enable determination of
 CC secondary scents and the identification of combinations of odour
 CC receptors that are involved in detecting such secondary scents. This
 CC enables the construction of a scent representation (also called a scent
 CC fingerprint or scent profile), which may be used to re-create and edit
 CC scents. Libraries of olfactory receptors are useful for determining the
 CC interaction pattern of a composition with the receptors, and can be used
 CC for determining differences in the olfactory faculties of different
 CC individuals. The present sequence is homologous to a conserved region in
 CC transmembrane segment 2 (TM2) of G-protein coupled receptors. It was used
 CC in the isolation of human olfactory receptor cDNAs

PT Genetically-modified Candida utilis for producing foods and drinks
PT enriched with gamma-glutamyl cysteine or cysteine, useful in food
PT industry e.g. for seasoning, by culturing and processing to enhance
PT flavor.
XX
PS Example 1; SEQ ID NO 11; 70pp; Japanese.
XX
CC The invention relates to a novel method for producing a food containing
CC gamma-glutamyl cysteine or cysteine comprising culturing under
CC appropriate conditions Candida utilis (Pichia jadinii) containing 1% or
CC more by weight of gamma-glutamyl cysteine based on dry cells in the
CC logarithmic growth phase when cultured in the minimum medium, adding the
CC obtained culture, optionally after heating, to a food or drink material
CC and processing. The yeast of the invention may be used for producing food
CC and drink with enriched gamma-glutamyl cysteine or cysteine which is
CC useful in food industry e.g. for seasoning. In this way, food and drink
CC can be cheaply produced with improved flavour. The current sequence is
CC that of the food enrichment-related PCR primer of the invention.

PT Inhibiting transcription of duplex DNA in anti-sense therapy and
PT diagnosis by contacting the transcribed region of DNA with an oligomer
PT to form triple helix.
XX
PS Table 1; Page 26; 45pp; English.
XX
CC The oligomer is used as a control oligonucleotide for studying inhibition
CC of transcription of duplex DNA. Similar oligomers are capable of binding
CC to the transcribed region of the DNA so as to form a triple helix. This
CC interaction is compared to the binding of the control oligonucleotide to
CC give accurate results. The target region may lie within an exon or an
CC intron and the oligomer forms a triple helix by exploiting the GT motif
CC (i.e. the oligomer is purine rich). The oligomer is useful in antisense
CC therapy. It can also be used (opt. in labelled form) diagnostically to
CC detect target DNA or RNA by hybridisation. See also AAQ25290-300.

PT New DNA sequences as DNA probes - for use in paternity and maternity

```

PT testing, analysis of tumour cells, animal or plant breeding, etc.

PS Claim 1; Page 13; 13pp; English.

XX The DNA probes represented in AAQ22441-76 are 15 nucleotide sequences
CC wherein 8 nucleotides of each sequence are G, 3 are T, 1 is C, 1 is A and
CC 2 are N, except that the nucleotide sequence is not the M13 consensus
CC sequence GAGGGTGGGNNCT. The probes can detect hyper-variable regions
CC (HVRs) in genomic DNA with such precision as to enable individuals to be
CC identified or fingerprinted by reference to variations in their DNA in
CC these regions. The DNA probes can be used in paternity and maternity
CC testing, zygosity testing in twins, cell chimerism studies, e.g.
CC detection of donor versus recipient cells after bone marrow
CC transplantation, forensic medicine, family gp. verification, tests for
CC inbreeding, pedigree analysis, identification of loci or genetic
CC diseases, animal or plant breeding and pedigree analysis authentication,
CC quality control of cell lines and analysis. Preparation: The M13 sequence
CC was initially randomised manually by the method of random sampling
CC without replacement to produce random sequences. Later a computer
CC programme was written that implemented an algorithm that produced a
CC random sequence by sampling without replacement. Several of the random
CC sequences that were obtd. were synthesised, labelled and used as DNA
CC probes

XX Ribozymes having modified bases and methods for producing them - for use

PT in inhibiting disease related genes.

XX Claim 2; Page 226; 407pp; English.

XX The present sequence represents a preferred target sequence for an

CC enzymatic nucleic acid (i.e. a ribozyme) which cleaves reIA mRNA at the

CC nucleotide base position indicated in the DE line. The reIA gene product

CC is a subunit of the transcriptional regulator NF-kappaB and is implicated

CC specifically in the induction of inflammatory responses. Regions of the

CC mRNA that do not form secondary folding structures and that contain

CC potential hammerhead and hairpin ribozyme cleavage sites were identified

CC by computer analysis. Ribozymes directed against these mRNA sequences

CC were designed and synthesised with modifications that improve their

CC nuclease resistance. The ribozymes are designed to cleave the target

CC sequences and thereby inhibit reIA expression, making them potentially

CC useful for treating rheumatoid arthritis, restenosis and asthma as well

CC as for increasing tolerance to transplanted tissues. The potential

CC immunosuppressive properties of a ribozyme that cleaves reIA mRNA means

CC that uses are limited to local delivery, acute indications or ex vivo

CC treatment. (Updated on 25-MAR-2003 to correct PI field.)

XX PT New ribozyme(s) for cleaving cholesterol ester transfer protein mRNA -
XX PT useful for preventing or treating initial development, progression or
XX PT regression of vascular diseases, esp. familial hypercholesterolaemia.
XX PS Claim 4; Page 42; 72pp; English.
XX CC AAT50138-T50359 represent target sequences for the rabbit cholesterol
XX CC ester transfer protein (CETP) hammerhead (HH) ribozymes (see AAT50360-
XX CC T50546). CETP is a 74 kD glycoprotein that facilitates neutral lipid
XX CC transfer between plasma lipoproteins. The numbering of the targets refers
XX CC to the position of the cleavage site in full length CETP. The ribozyme
XX CC then binds to 5 nucleotides either side of this site. The ribozymes are
XX CC able to cleave mRNA from the gene encoding CETP, thereby blocking
XX CC synthesis and/or expression of the mRNA. By inhibiting CETP, the reverse
XX CC cholesterol transport (RCT) pathway can be inhibited (or eliminated)
XX CC thereby preventing the reduction in size density of the high density
XX CC lipoproteins (HDL), prolonging HDL half life, and therefore increasing
XX CC HDL levels. The ribozymes can be used to treat conditions associated with
XX CC abnormal levels of CETP, specifically atherosclerosis, familial
XX CC hypercholesterolaemia, peripheral vascular disease, dyslipidaemia,
XX CC hyperbetalipoproteinaemia, hypoalphalipoproteinaemia, vascular
XX CC complications of diabetes, transplant, atherectomy and angioplastic
XX CC restenosis. By inhibiting CETP, the levels of HDL and low density
XX CC lipoproteins (LDL), and the HDL:LDL ratio are favourably altered (a
XX CC decrease in LDL levels, and a corresponding increase in HDL levels). The
XX CC HH ribozymes can also be used diagnostically to study genetic drift and
XX CC mutations in diseased cells, and to detect CETP mRNA. As the HH ribozymes
XX CC target specific regions of the CETP gene, they have low non-specific
XX CC activity

XX CC ester transfer protein (CETP) hammerhead (HH) ribozymes (see AAT50360-
XX CC T50546). CETP is a 74 kD glycoprotein that facilitates neutral lipid
XX CC transfer between plasma lipoproteins. The numbering of the targets refers
XX CC to the position of the cleavage site in full length CETP. The ribozyme
XX CC then binds to 5 nucleotides either side of this site. The ribozymes are
XX CC able to cleave mRNA from the gene encoding CETP, thereby blocking
XX CC synthesis and/or expression of the mRNA. By inhibiting CETP, the reverse
XX CC cholesterol transport (RCT) pathway can be inhibited (or eliminated)
XX CC thereby preventing the reduction in size density of the high density
XX CC lipoproteins (HDL), prolonging HDL half life, and therefore increasing
XX CC HDL levels. The ribozymes can be used to treat conditions associated with
XX CC abnormal levels of CETP, specifically atherosclerosis, familial
XX CC hypercholesterolaemia, peripheral vascular disease, dyslipidaemia,
XX CC hyperbetalipoproteinaemia, hypoalphalipoproteinaemia, vascular
XX CC complications of diabetes, transplant, atherectomy and angioplastic
XX CC restenosis. By inhibiting CETP, the levels of HDL and low density
XX CC lipoproteins (LDL), and the HDL:LDL ratio are favourably altered (a
XX CC decrease in LDL levels, and a corresponding increase in HDL levels). The
XX CC HH ribozymes can also be used diagnostically to study genetic drift and
XX CC mutations in diseased cells, and to detect CETP mRNA. As the HH ribozymes
XX CC target specific regions of the CETP gene, they have low non-specific
XX CC activity

Preparation of antisense oligonucleotide(s) which lack long runs of consecutive guanosine or inosine - and have specific ratio of residues able to form two or three hydrogen bonds, have greater activity and reduced toxicity, used therapeutically or to modulate growth of cells in culture.
PT

Claim 10; Fig 6a; 286pp; English.
PS

AAV48709-886 represent antisense oligonucleotides directed against the ErBB-2 gene. Of these, only oligonucleotides AAV48709-91 resulted in significant reduction in ErBB-2 protein expression, while oligonucleotides AAV48792-886 had little effect. The oligonucleotides exemplify the invention. The specification describes oligonucleotides that contain 8-30 nucleotides, which contain at most 8 nucleotides that can each form three hydrogen bonds to cytosine; do not contain four consecutive nucleotides able to form three H-bonds each to four consecutive cytosines; do not contain two sequences of three consecutive nucleotides each able to form three H-bonds to three consecutive cytosines, and the ratio between residues able to form two H-bonds each (2R) or three such bonds (3R) is given by 2R/3R = 0.33-0.72. The oligonucleotides are used to modulate expression of genes, particularly the genes for p53, ErB-2, junB, junD, TGF-beta 1 or beta 2 to control proliferation of primary cell cultures (e.g. bone marrow stem, liver or kidney cells, osteoclasts, osteoblasts and/or keratinocytes). The oligonucleotides can also be used to analyse function of proteins (by altering their expression or activity) and therapeutically, e.g. in cases of cancer or (targeting TGF) for stimulating the immune system

Branched compositions for improving the solubility of synthetic polymers or minimizing or eliminating polymer self-aggregation, particularly in peptide nucleic acids.
PT

Example 12; Page 40; 81pp; English.
PS

The present invention describes a branched composition (I) which is useful for improving the solubility of synthetic polymers (II) or aids in minimizing or eliminating self-aggregation of (II), where (II) is a nucleic acid (or analogue), peptide, peptide nucleic acid (PNA), (I) can facilitate synthesis, purification and analysis of (II) by (I) can polymers, and particularly purine-rich PNA polymers labeled with hydrophobic labels. The products can be used in research, diagnostic and therapeutic applications. The present invention represents a PNA used in the exemplification of the present invention

XX
CC The present sequence represents the preferred target sequence of an
CC enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves
CC the Hepatitis C virus (HCV) RNA sequence at the base position given in
CC the descriptor line. The HCV sequence was screened for optimal ribozyme
CC target sites using a computer folding algorithm and regions of the mRNA
CC which did not form secondary folding structures and contained potential
CC ribozyme cleavage sites were identified. Ribozymes were synthesised to
CC target these sites and their activities optimised by either varying the
CC length of the binding arms or by modification to prevent degradation by
CC nucleases. The ribozymes of the invention inhibit gene expression and/or
CC viral replication, and are used to treat diseases associated with
CC Hepatitis C virus (HCV) infection, e.g. cirrhosis, liver failure and
CC hepatocellular carcinoma. The ribozymes may be used in combination with
CC interferon to treat HCV infection, other infectious diseases, autoimmune
CC diseases, and cancer

```

CC The present sequence is a probe used to detect polymorphisms in the human
 CC osteoclastogenesis inhibitory factor (TNFRSF11B). Polynucleotides
 CC comprising one or more of twenty four novel single nucleotide
 CC polymorphisms in the TNFRSF11B gene have been identified. TNFRSF11B
 CC regulate osteoclast recruitment and function. An understanding of
 CC variations in the gene should thus be useful in developing new therapies
 CC for metabolic disorders caused by abnormal osteoclast recruitment and
 CC function such as osteoporosis, metastatic bone disease, Paget's disease,
 CC rheumatoid arthritis and periodontal bone disease

 PT diagnosis of tumors, viral infection and cellular degeneration and for
 PT drug screening.

XX Claim 1; Page 486; 623pp; French.

XX The present invention relates to novel human nucleic acid sequences (I).
 CC The present sequence is one such nucleic acid sequence. Expression of (I)
 CC are implicated in tumour suppression or reversion and apoptosis and viral
 CC resistance. (I) are useful as probes or primers for detecting,
 CC identifying, measuring and/or amplifying nucleic acid sequences, as
 CC antisense reagents and for recombinant production of polypeptides. (I),
 CC polypeptides (II) encoded by (I), vector containing (I), cells containing
 CC these vectors and antibodies (Ab) against (II) are all useful for
 CC treatment/prevention of viral, tumour and cell degeneration diseases
 CC (especially neurodegeneration, such as Alzheimer's disease and
 CC schizophrenia). Analysing the expression of (I) is also useful for
 CC diagnosis and/or prognosis of such diseases. Transgenic animals carrying
 CC (I) are used for studying the aetiology of these diseases (also immune
 CC and inflammatory diseases). Note: In the present specification, SEQ ID 1
 CC to 2280 are claimed in Claim 1, however only SEQ ID 1 to 2270 are shown

XX Duda A, Kliem SE, Koshiy B, Parks KE;

XX WPI; 2002-130786/17.

XX Novel genetic variants of 3-hydroxy-3-methylglutaryl coenzyme A lyase
 PT useful in screening drugs to treat disease associated with the protein
 PT e.g. 3-hydroxy-3-methylglutaryl coenzyme A deficiency.

XX Claim 17; Page 13; 84pp; English.

XX The present invention relates to a new polynucleotide having a sequence
 CC comprising a 3-hydroxy-3-methylglutaryl coenzyme A lyase (HMGCL) isogene,
 CC selected from 6 isogenes, and defined by a corresponding set of
 CC polymorphisms whose locations and identities are given in the
 CC specification. The method of the invention is useful for haplotyping the
 CC HMGCL gene in an individual and in design of clinical trials of candidate
 CC drugs for treating a specific condition or disease predicted to be
 CC associated with HMGCL activity and is useful for genotyping HMGCL gene of
 CC an individual. The method of the invention is also useful for identifying
 CC an association between a trait and at least one haplotype or for assaying
 CC a pair of HMGCL gene. ASO is useful as probes and primers and for assaying
 CC a polymorphism in the target region. The invention is useful for
 CC genotyping and/or haplotyping the HMGCL gene in an individual. Without
 CC requiring any a prior knowledge of the phenotypic effect of any
 CC particular HMGCL haplotype or haplotype pair, the method of the invention
 CC provides the scientist with a tool to identify lead compounds that are
 CC more likely to show efficacy in clinical trials. The present nucleic acid
 CC sequence represents one of a collection of ASO probes (ABK14040-ABK14045)
 CC that were used in the invention to detect polymorphisms in the human
 CC HMGCL gene

XX New ribozymes targeting RNA derived from hepatitis C virus inhibit viral
PT replication and are useful to treat hepatitis C virus infections and
PT cirrhosis, liver failure or hepatocellular carcinoma.
XX
PS Claim 1; Page 57; 80pp; English.
XX
CC The present invention relates to enzymatic nucleic acids which
CC specifically cleave RNA derived from Hepatitis C virus (HCV). The
CC enzymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin
CC (Hp) motif where the binding arms comprise sequences complementary to one
CC of the substrate sequences defined in the specification. The HCV
CC ribozymes are useful for modulating the expression and/or replication of
CC HCV. They can be used to treat cirrhosis, liver failure and/or
CC hepatocellular carcinoma. The HCV ribozymes are also useful for treating
CC a condition associated with HCV infection in conjunction with one or more
CC other drug therapies, particularly type I interferon, especially
CC interferon alpha, beta or gamma or consensus interferon. The present
CC sequence represents a substrate for a HCV hammerhead (HH) ribozyme. Note:
CC Some of the sequence data for this patent did not form part of the
CC printed specification. The complete sequence data for this patent was
CC obtained in electronic format directly from the USPTO web site at
CC seqdata.uspto.gov/psipsdIDentry.html

XX PT Peptide nucleic acid probes for detecting target sequences of
XX Mycobacteria in samples, e.g., sputum, which are capable of hybridizing
XX to a target sequence of mycobacterial rDNA, precursor rRNA or rRNA
XX forming detectable hybrids.
XX
XX PS Claim 22; Page 37; 74pp; English.
XX
XX CC The invention relates to a peptide nucleic acid capable of hybridizing to
XX a target sequence of Mycobacterial rDNA, precursor rRNA or rRNA (5S, 16S
XX or 23S) forming detectable hybrids. Also included are detecting a target
XX sequence of mycobacteria in a sample comprising contacting rRNA or rDNA
XX in the sample with peptide nucleic acid probes (hybridisation takes place
XX between the probe and the rRNA or rDNA), observing or measuring any
XX formed detectable hybrids and relating the observation or measurement to
XX the presence of a target sequence of mycobacteria in the sample, and a
XX kit for detecting a target sequence of mycobacteria in particular a
XX target sequence of mycobacteria of M. tuberculosis complex (MTC). The
XX probes are used for detecting a target sequence of MTC (and
XX distinguishing them from mycobacterium other than tuberculosis, MOTT)
XX present in a sample, e.g. sputum, laryngeal swabs, gastric lavage,
XX bronchial washings, biopsies, aspirates, expectorates, body fluids,
XX urine, tissue sections as well as food samples, soil, air and water
XX samples and their cultures. The probe is able to penetrate the cell wall
XX of the mycobacteria. It is able to hybridise to Mycobacterial precursor
XX rRNA and rRNA without harsh treatment of the mycobacterial cells,
XX therefore avoiding a risk of interfering with the morphology of the
XX cells. The present sequence is an M. tuberculosis probe for 16S or 23S
XX rRNA

CC heterologous sequence, diagnosing or prognosing glaucoma in a sample
CC obtained from a cell or bodily fluid (comprising detecting a polymorphism
CC in a promoter region of the optineurin gene, associated with a glaucoma
CC phenotype), detecting a SNP sequence variation in a sample containing
CC DNA, detecting the presence of an optineurin promoter sequence variation
CC in a sample containing DNA, determining the presence or increased
CC susceptibility to glaucoma or to a progressive ocular hypertensive
CC disorder resulting in loss of visual field in a patient for the severity
CC or progression of glaucoma in a patient, comprising providing
CC amplification reaction primers that direct amplification of a selected
CC nucleic acid region containing the variation within the optineurin
CC promoter and amplifying the DNA) and detecting a polymorphism (comprising
CC obtaining a sample containing human genomic DNA, providing a nucleic acid
CC capable of detecting a SNP located within an optineurin promoter, and
CC detecting the polymorphism). The invention is used to diagnose and
CC prognose glaucoma and also to treat glaucoma related disorders. The
CC present sequence is an optineurin promoter motif, repeat element or
CC putative regulatory region.

XX PT
XX PT New nucleic acid encoding an isolated G-protein coupled receptor useful
XX PT for treating nervous system related disorders.
XX PS Disclosure; Col 49; 64pp; English.
XX CC The present invention describes muscarinic acetylcholine receptor 6
XX CC (mAChR-6), which is a member of the G family of proteins. mAChR-6 has
XX CC antiparkinsonian, nootropic, neuroprotective, neuroleptic, antidiabetic
XX CC antidepressant, antiarrhythmic and antiinflammatory activities. The mAChR
XX CC -6 protein, is capable of modulating the effects of a G-protein coupled
XX CC receptor (GPCR) ligand such as acetylcholine or an acetylcholine like
XX CC molecule such as carnitine, e.g. by modulating phospholipase C
XX CC signalling/activity. Products from the present invention can be used for
XX CC treating disorders mediated by abnormal mAChR-6 protein activity such as
XX CC nervous system related disorders, disorders affecting consciousness,
XX CC affective disorders such as REM sleep abnormalities, disorders affecting
XX CC pain generation mechanisms such as pain related to irritable bowel
XX CC syndrome or chest pain, movement disorders, eating disorders, drinking
XX CC disorders, smooth muscle related disorders, cardiac muscle disorders, and
XX CC gland related disorders such as xerostomia or diabetes mellitus. The
XX CC products can also be used for detection, diagnosis and drug screening.
XX CC The present sequence represents a rat mAChR-6 antisense oligonucleotide
XX CC which is given in the exemplification of the present invention. (Updated
XX CC on 20-MAR-2003 to correct DR field.)

XX PT diagnosis.
XX XX
XX PS Claim 9; Page 70; 83pp; Japanese.
XX CC The present invention describes a method for distinguishing a human
XX CC leukocyte antigen (HLA) class I antigen or allele by a combination of
XX CC polymerase chain reaction (PCR) using a primer pair whereby all HLA-A, -B
XX CC or -C alleles can be amplified or using reverse hybridisation analysis
XX CC comprising a DNA probe covalently bonded to microtitre plate wells which
XX CC are hybridisable specifically with the base sequence of at least one
XX CC specific HLA-A, -B or -C allele. The method is applicable in gene typing,
XX CC judging donor-recipient compatibility during organ transplant and
XX CC correlation analysis for diagnosis of various diseases. The method is
XX CC simple, rapid and accurate, with possibility of mechanisation and
XX CC automation, without the problems encountered by using the prior-art
XX CC techniques. AAA66943 to AAA67072 represent oligonucleotide probes and PCR
XX CC primers for use in the method of the present invention

XX PT Screening for sodium channel activity modulators, used to decrease

```

PT neuropathic pain, comprises contacting a candidate compound with a cell
 PT expressing the channel.
 XX
 PS Example 1; Page 78; 124pp; English.
 XX
 CC The invention relates to a method of screening for a modulator of sodium
 CC channel activity that comprises contacting a candidate modulator with a
 CC cell co-expressing a sodium channel beta-1A subunit with a sodium channel
 CC alpha subunit, and determining the effect of the candidate modulator on
 CC the sodium channel function in the cell. The method is useful for
 CC identifying sodium channel activity modulators, preferably causing
 CC decreased beta 1A subunit expression. The modulators can be used to
 CC decrease neuropathic pain, and to decrease the number of febrile seizures
 CC in an individual. The present sequence represents a reverse primer
 CC beta1A5 used in RT-PCR amplification of the DNA encoding a rat sodium
 CC channel beta-1A subunit

 XX
 CC An isolated nucleic acid encoding a sodium channel beta1A subunit
 PT polypeptide, useful for identifying modulators of sodium channel beta1A
 PT subunits and treating neuropathic pain.
 XX
 PS Example 1; Page 79; 121pp; English.
 XX
 CC The present sequence is that of PCR primer beta1A5. The primer is based
 CC on a sequence unique to rat sodium channel beta1A subunit. It was used
 CC with primer beta1A3 (see AAF30670) to confirm that a beta1A transcript
 CC identified by library screening was expressed by rat adrenal gland. The 2
 CC primers amplify a region of beta1A from the N-terminus past the region in
 CC which the amino acid sequence changed from identity to non-identity to
 CC beta1, or the putative splice site, by RT-PCR using rat adrenal gland
 CC total RNA as template. Novel rat sodium channel beta1A subunit (see
 CC AAB20371) is a splice variant of sodium channel beta1, resulting from

CC retention of intron 3 containing an in-frame stop codon. This alternative
 CC splicing event produces a novel C-terminus. Methods and compositions for
 CC using beta1A nucleic acids and proteins are described. A claimed method
 CC of screening for a modulator of sodium channel activity utilises a cell
 CC co-expressing a sodium channel beta1A subunit and a sodium channel alpha
 CC subunit. A claimed method for decreasing neuropathic pain, and a claimed
 CC method for decreasing the number of fibrillar seizures in an individual,
 CC both involve administering a modulator of the sodium channel beta1A
 CC subunit

 CC Inducing apoptosis in a tumor cell for treating cancer, e.g. prostate
 CC cancer, by introducing a DNA construct comprising coding region of DNA
 CC repair inhibitory agent linked to tissue-specific regulatory sequences.
 PS Example; Page 19; 41pp; English.
 XX
 CC The invention relates to inducing (M) apoptosis in a cell for treating
 CC cancer, comprising introducing into the cell a recombinant DNA construct
 CC having the coding region of a DNA repair inhibitory agent linked to
 CC tissue-specific transcriptional regulatory sequences. (M) is useful for
 CC inducing apoptosis in a tumor cell, including lung, breast, colon, liver,
 CC brain, kidney, skin, or ovarian tumour cell, squamous cell carcinoma, non
 CC squamous cell carcinoma, glioblastoma, sarcoma, melanoma, papilloma, such
 CC neuroblastoma and leukaemia cell. (M) is useful for treating cancer, such
 CC as brain, stomach, breast, ovarian, cervical, prostate, skin, lung,
 CC pancreatic, liver, colon cancer and leukaemia. The method involves
 CC administering the DNA construct and inducing apoptosis of cancer cells by
 CC treating the host by genotoxic treatments. The host is a human diagnosed
 CC with cancer. The genotoxic treatments comprises chemotherapeutic drugs or
 CC radiation such as gamma-irradiation, X-rays, microwaves, electronic
 CC emissions and the like. The chemotherapeutic drugs are alkylating agents
 CC (e.g. cis-diamine dichloroplatinum or melphalan), inhibitors of DNA
 CC replication, mitosis or chromosomal segregation, (e.g. etoposide (VP-16),

CC camptothecin and adriamycin also known as doxorubicin) and radiomimetic
 CC agents (e.g. bleomycin). The present sequence is that of a PCR primer for
 CC RT-PCR analysis of a human DBD-Flag fusion protein used in examples of
 CC the invention

 XX New muscarinic acetylcholine receptor 6 (mAChR-6) nucleic acids and
 PT proteins, useful for modulating acetylcholine or phosphatidylinositol,
 PT particularly for treating e.g. schizophrenia, chest pain, tachycardia or
 PT arrhythmia.

PS Disclosure; Page 26; 66pp; English.
 XX
 CC The invention relates to an isolated human or rat muscarinic
 CC acetylcholine receptor 6 (mAChR-6) nucleic acid molecule and the encoded
 CC protein. Also included are (non-human) host cells comprising the mAChR-6
 CC nucleic acid molecule, an antibody that selectively bind the polypeptide
 CC above, a method for producing the polypeptide by culturing the host cell
 CC such that the mAChR-6 nucleic acid is expressed, a method for detecting
 CC the presence of the mAChR-6 polypeptide and nucleic acid, a method for
 CC identifying a compound that binds to the mAChR-6 polypeptide and a method
 CC for modulating the activity of the mAChR-6 polypeptide. The mAChR-6
 CC polynucleotide, polypeptide, antibody or modulator are useful in drug
 CC screening assays, diagnostic assays for identifying diseases, allelic
 CC screening, pharmacogenetic testing, methods of treatment,

CC pharmacogenomics or monitoring the effects during clinical trials. In
 CC particular, the mAChR-6 polynucleotide, polypeptide or antibody is useful
 CC for treating or diagnosing cognitive disorders (e.g. amnesia, amnesic
 CC spatial disorientation, Klüver-Bucy syndrome, Alzheimer's related memory
 CC loss or learning disability), disorders affecting consciousness (e.g.
 CC visual hallucinations or delirium), schizo-affective disorders (e.g.
 CC schizophrenia or depression), affective disorders (e.g. sleep disorders),
 CC disorders affecting pain generation mechanisms (e.g. pain related to
 CC irritable bowel syndrome, or chest pain), movement disorders (e.g.
 CC Parkinson's disease), eating disorders (e.g. insulin hypersecretion
 CC obesity), heart muscle related disorders (e.g. bradycardia, tachycardia,
 CC arrhythmia, flutter or fibrillation), or gland related disorder (e.g.
 CC xerostomia or diabetes mellitus). The present sequence is an antisense
 CC oligonucleotide targeting human mAChR-6

XX Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA
 PT stability - useful for treating e.g. tumour angiogenesis, psoriasis,
 PT rheumatoid arthritis, etc., in a human patient.
 XX
 PS Claim 4; Page 81; 218pp; English.

CC The present invention describes nucleic acid molecules which modulate the
 CC synthesis, expression and/or stability of a mRNA encoding 1 or more
 CC receptors of vascular endothelial growth factor (VEGF). A patient
 CC (preferably human) having a condition associated with the level of the
 CC fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing
 CC receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour
 CC angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be

CC treated by administering the nucleic acid molecule or the expression
CC vector to the patient. AAX67275 to AAX75752 represent specific examples
CC of nucleic acid molecules from the present invention

 XX Enzymatic nucleic acids - which cleave RNA derived from an epidermal
 PT growth factor receptor, useful for inhibiting cell proliferation and for
 PT treating cancers.
 XX Claim 5; Page 68; 109pp; English.
 XX The present invention describes enzymatic nucleic acid molecules (NAMS)
 CC which specifically cleave RNA derived from an epidermal growth factor
 CC receptor (EGF-R) gene. AAV97221 to AAV98043 and AAV98979 to AAV99090
 CC represent specifically claimed target sequence from human EGF-R. AAV98044
 CC to AAV98866 and AAV98867 to 9878 represent hammerhead ribozymes and
 CC hairpin ribozymes respectively for human EGF-R. The NAMS are useful for
 CC cleaving EGF-R RNA in the treatment of a condition associated with EGFR
 CC expression levels e.g. to inhibit cell proliferation in the prevention or
 CC treatment of cancers. The NAMS can also be used as diagnostic tools to
 CC examine genetic drift and mutations within diseased cells or to detect
 CC the presence of EGF-R RNA in a cell

 CC A method has been developed for detecting the presence or absence of a
 CC single nucleotide polymorphism (SNP) allele in a genomic sample. The
 CC method comprises preparing a reduced complexity genome (RCG) from the
 CC genomic sample and analysing the RCG for the presence or absence of a SNP
 CC allele. The method can be used to characterise a tumour, to generate a
 CC genomic pattern for an individual genome or to generate a genomic
 CC classification code for a genome. The method can be used to assess
 CC whether a subject is at risk for developing a disease or to identify a

CC set of SNP alleles associated with a disease. The method can also be used
CC to perform linkage analysis. AAA35944 to AAA35947 represent sequences

XX New nucleic acids that interact, and optionally cleave, target sequences,
PT used to treat cancer.
PT
PS Claim 77; Page 69; 148pp; English.
XX
XX The present invention describes nucleic acids (A) that interact stably
CC with a target sequence and contain at least one phosphorodithioate
CC link, having endonuclease activity. (A), and more generally any catalytic
CC nucleic acid (A') that modulates expression of the oestrogen receptor
CC gene, are used to treat cancer (particularly of breast or endometrium),
CC in vivo or by transforming cells ex vivo and implanting treated cells, or
CC for other conditions associated with levels of oestrogen receptor.
CC Because of the high selectivity for targeted RNA, (A) can also be used to
CC correlate inhibition of gene expression with alterations in phenotype,
CC particularly for identification of therapeutic targets, and as research
CC reagents (for RNA, in the same way that restriction endonucleases are
CC used with DNA). The combination of modifications in (A) improves
CC resistance to nucleases, binding affinity and/or activity. AAA23503 to
CC AAA24747 represent oestrogen receptor hammerhead ribozyme sequences, and
CC AAA24748 to AAA25992 represent their corresponding target sequences.
CC AAA25993 to AAA26105 represent oestrogen receptor hairpin ribozyme
CC sequences, and AAA26107 to AAA26218 represent their corresponding target
CC sequences. AAA26219 to AAA26271 represent other ribozyme sequences and
CC antisense oligonucleotides used in the exemplification of the present
CC invention

XX Enzymatic and antisense nucleic acid inhibition of repressor genes,
PT useful for producing e.g. granulocyte colony stimulating factor protein,
PT interferon alpha and erythropoietin.
XX
XX Claim 4; Page 97; 164pp; English.
XX
XX The present invention relates to enzymatic and antisense nucleic acid
CC molecules that act as inhibitors of the expression of repressor genes
CC encoding the Tr2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcription
CC factor gene, IRF-2 and/or the CAAAT Displacement Protein (CDP).
CC Inhibition of the repressors removes prevents inhibition (and
CC consequently increases expression of) genes involved in the production of
CC erythropoietin, granulocyte colony stimulating factor protein and
CC interferon alpha

XX Universal array of oligonucleotides tags attached to a solid substrate
PT along with locus-specific tagged oligonucleotides useful in genotyping
PT using single base extension reactions.
XX Example 7; Page 56; 70pp; English.
XX The present invention relates to an oligonucleotide array comprising
CC oligonucleotide tags fixed to a solid substrate. The oligonucleotide
CC array is useful for genotyping a nucleic acid sample at one or more loci
CC via single base extension (SBE) reactions. A pair of primers is used to
CC amplify a polymorphic locus in a sample e.g. a single nucleotide
CC polymorphism (SNP). The present sequence is one of the primers used in
CC the method of the present invention to amplify a polymorphic sample. The
CC amplified nucleic acid product is then used as a template in a SBE
CC reaction with an extension primer. The SBE reaction products are used to
CC form the oligonucleotide array

Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense
constructs, which down regulate expression of a CD20 gene or neurite
growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and
central nervous system injury.

Claim 88; Page 66; 200pp; English.

The invention relates to a nucleic acid molecule which down regulates
expression of a CD20 gene and a nucleic acid molecule which down
regulates expression of a neurite growth inhibitor gene (NOGO). The
nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a
DNAzyme) an inozyme (an endolytic nucleic acid cleaving an RNA molecule
possessing an NCH motif), a G-cleaver (cleaving RNA with a NYN motif) or
an amberzyme (cleaving RNA with an NGN triplet), a zinczyme (cleaving RNA
with a VGY motif). The CD20-targeting nucleic acid is used to cleave RNA
of CD20 in the presence of a divalent cation that is preferably Mg²⁺.
Furthermore, it may be contacted with a cell to reduce CD20 activity of
the cell and treat a patient having a condition associated with the level
of CD20. The treatment may further comprise the use of one or more
therapies. In particular, the CD20 targeting nucleic acid may be used to
treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-
Hodgkin's lymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic
leukaemia, HIV (human immunodeficiency virus) associated NHL, mantle-cell
lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma,
immune thrombocytopaenia, and inflammatory arthropathy. The NOGO-
targeting nucleic acid is used to cleave RNA of the NOGO gene in the
presence of a divalent cation that is preferably Mg²⁺. Furthermore, the
nucleic acid may be contacted with a cell to reduce NOGO activity of the
cell and treat a patient having a condition associated with the level of
NOGO. The treatment may further comprise the use of one or more
therapies. In particular, the NOGO-targeting nucleic acid may be used to
treat central nervous system (CNS) injury and cerebrovascular accident
(CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS),

chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS), Parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob disease, muscular dystrophy, and/or other neurodegenerative disease states which respond to the modulation of NOGO expression. The present invention is a hammerhead ribozyme of the invention

 Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury.
 Claim 88; Page 81; 200pp; English.
 The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NOGO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a DNzyme) an inozyme (an endolytic nucleic acid cleaving an RNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with a NYN motif) or an amberyzyme (cleaving RNA with an NGN triplet), a zinzyme (cleaving RNA with a YGY motif). The CD20-targeting nucleic acid is used to cleave RNA of CD20 in the presence of a divalent cation that is preferably Mg²⁺. Furthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more therapies. In particular, the CD20 targeting nucleic acid may be used to treat lymphoma, leukemia, B-cell lymphoma, low-grade or follicular non-treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular NHL, Hodgkin's lymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic leukaemia, HIV (human immunodeficiency virus) associated NHL, mantle-cell lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, immune thrombocytopaenia, and inflammatory arthropathy. The NOGO-targeting nucleic acid is used to cleave RNA of the NOGO gene in the presence of a divalent cation that is preferably Mg²⁺. Furthermore, the nucleic acid may be contacted with a cell to reduce NOGO activity of the cell and treat a patient having a condition associated with the level of NOGO. The treatment may further comprise the use of one or more therapies. In particular, the NOGO-targeting nucleic acid may be used to treat central nervous system (CNS) injury and cerebrovascular accident (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS), chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS), Parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob disease, muscular dystrophy, and/or other neurodegenerative disease states which respond to the modulation of NOGO expression. The present sequence is an inozyme of the invention

Novel VRN1 polynucleotide sequence encoding a polypeptide which alters
vernalization response of plant in which VRN1 nucleic acid is expressed,
useful for influencing and assessing vernalization phenotype of plants.
Claim 10; Page 75; 91pp; English.
The present invention provides the protein and coding sequences of
Arabidopsis thaliana VRN1. This protein is capable of altering the
vernalisation responses of a plant. Also provided are a number of PCR
primers used to isolate the sequences. The sequences are useful in the
production of crop plants, where they are able to control the timing of
flowering, the duration of vernalisation required, the optimum
temperature, or even eliminate the need for vernalisation completely. The
present sequence is a PCR primer used to isolate the VRN1 coding sequence

PT Detecting extracellular mutated oncogene DNA in animal without clinically

```

PT -diagnosed cancer, involves preparing and enriching mutated oncogene DNA,
PT amplifying enriched DNA and detecting the product of amplified DNA.

XX Disclosure; Page 22; 53pp; English.

XX The present invention describes a method for detecting (D1) extracellular
CC mutated oncogene DNA (I) in blood (B) from a human or animal without
CC clinically-diagnosed cancer, which involves preparing (I) or its fragment
CC from (B), enriching (I) by concentrating and/or isolating (I) from the
CC remaining extract, amplifying enriched (I) or a signal from enriched (I),
CC and detecting the product of amplified (I), or its amplified signal. Also
CC described are: (1) determining (D2) the presence of non-haemopoietic
CC cells or tissue having a mutated oncogene allele in a human without
CC clinically-diagnosed cancer; and (2) determining (D3) an acquired
CC predictive risk factor for a non-haematologic disease in a human without
CC clinically-diagnosed cancer. D1 is useful for quantitatively and
CC qualitatively detecting extracellular mutated oncogene DNA in blood from
CC a human or animal without clinically-diagnosed cancer. D2 is useful for
CC determining the presence of non-haemopoietic cells or tissues having a
CC mutated oncogene allele in a human without clinically diagnosing cancer.
CC D3 is useful for determining an acquired predictive risk factor for a non
CC -haematologic disease in a human without clinically-diagnosed cancer. The
CC methods are useful for detecting, monitoring, evaluating or risk
CC assessment of pre-malignant conditions, and in particular to conditions
CC including colorectal adenoma, cervical dysplasia, atypical squamous
CC metaplasia of the lung, bronchial dysplasia, atypical hyperplasia of the
CC breast, prostatic intraepithelial neoplasia, atypical endometrial
CC hyperplasia, dysplastic nevi of the skin or Barrett's oesophagus. The
CC present sequence represents a mutant p53 oligonucleotide related to a
CC mutation involving codon 175 which is the most common mutation in
CC colorectal carcinoma, given in the exemplification of the present
CC invention

PT Apparatus and method for performing a large number of chemical and
PT biological reactions by bringing two arrays into close apposition and
PT allowing reactants on the surfaces of the two arrays to come into
PT contact.

XX Example 11; Fig 18B; 112pp; English.

XX The invention provides a novel system for performing reactions, that
CC comprises a first solid support with a reactant of each reaction
CC immobilized on to it, and a second solid support either providing a
CC second reactant confined to a specific area on the surface, or a chemical
CC/mechanical separation of the reactions, where the first and second solid
CC supports are assembled to provide an environment for performing the
CC reactions in parallel. The methods and apparatus are useful for
CC performing a large number of chemical and biological reactions,
CC especially polynucleotide amplification reactions and the detection of
CC sequence variations, expression levels and their functions. The method is
CC capable of generating large amounts of data or products per unit time by
CC carrying out large numbers of reactions in parallel. The process is also
CC amenable to full automation. Sequences AAF83164-179 represent probes used
CC in detecting amplified products by allele specific extension, the
CC products amplified by performing large numbers of PCR reactions using
CC array-immobilised and releasable primers

XX Detecting a target nucleic acid, for identifying microorganisms,
PT diagnosing infections or detecting genetic abnormalities, comprises
PT producing and detecting double-stranded hybrids between probes and the
PT target nucleic acid.

XX Claim 53; Page 25; 128pp; English.

XX The invention relates to detecting a target nucleic acid comprising (a)

CC hybridising a single-stranded or partially single-stranded target nucleic
 CC acid to a capture sequence probe and a signal sequence probe to form
 CC double-stranded hybrids between the probes and the target nucleic acid,
 CC where the capture sequence probe and the signal sequence probe are
 CC capable of hybridising to non-overlapping regions within the target
 CC nucleic acid and not hybridising to each other, (b) adding a blocker
 CC probe to the hybridisation reaction, where the blocker probe hybridises
 CC to excess non-hybridised capture sequence probes, (c) binding the hybrid
 CC to a solid phase to form a bound hybrid, and (d) detecting the bound
 CC hybrid. The method is used to detecting a target nucleic acid. The method
 CC is useful for identifying and classifying microorganisms, diagnosing
 CC infectious diseases, detecting and characterising genetic abnormalities,
 CC identifying genetic changes associated with cancer, studying genetic
 CC susceptibility to disease, and measuring response to various types of
 CC treatment. The method is also useful for detecting the presence of
 CC nucleic acid in test samples. The method is not only rapid and sensitive,
 CC but is also highly specific and capable of discriminating highly
 CC homologous nucleic acid target sequences. Blocker probes comprising
 CC oligonucleotides complementary to the capture sequence probes are used in
 CC the method to eliminate excess capture sequence probe, thus reducing the
 CC background signal in detection and increasing specificity of the assay.
 CC The present sequence is a blocker probe derived from HSV-1, HSV-2, HPV or
 CC HBV sequences

 XX An isolated molecule comprising an antibody variable region which
 XX specifically binds to an extracellular domain of a tumor endothelial
 XX marker (TEM) protein, useful for inhibiting tumor growth.

PS Disclosure; Page 20; 33pp; English.

XX The invention relates to an isolated molecule comprising an antibody
 CC variable region which specifically binds to an extracellular domain of a
 CC tumour endothelial marker (TEM) protein selected from ABB90732, ABB90740,
 CC ABB90749, ABB90750 and ABB90769. The antibodies which bind to TEM
 CC proteins have cytostatic, immunostimulant and antiangiogenic activity.
 CC They are useful for inhibiting tumour growth, neovascularisation in subjects
 CC bearing a vascularised tumour, polycystic kidney disease, diabetic
 CC retinopathy, rheumatoid arthritis and psoriasis. Human, mouse and rat TEM
 CC genes and the encoded proteins (ABL92075-ABL92141 and ABB90721-ABB90789)
 CC are disclosed, as are marker oligonucleotide sequences: tumour
 CC endothelial markers (TEM) ABL91996-ABL92041 and ABL92143-ABL92191; normal
 CC endothelial markers (NEM) ABL92042-ABL92074; and pan-endothelial markers
 CC (PEM) ABL91903-ABL91995. The present sequence is that of an
 CC oligonucleotide marker useful to the invention

XX
XX Disclosure; SEQ ID NO 707; 214pp; English.
XX
XX The present invention describes a human genome-derived myosin-like
XX protein 1 (hGDMPLP-1). The protein and polynucleotide sequences of hGDMPLP-
XX 1 can be used in gene therapy and vaccine production. The hGDMPLP-1
XX nucleic acids can be used as probes to detect, characterise and quantify
XX hGDMPLP-1 nucleic acids in samples, as amplification substrates, to
XX provide initial substrates for the recombinant engineering of hGDMPLP-1
XX protein variants having desired phenotypic improvements, and for
XX expressing the proteins. The hGDMPLP-1 proteins or polypeptides may be
XX used as immunogens to raise antibodies that specifically recognise hGDMPLP-
XX -1 proteins, as standards in assays used to determine the concentration
XX and/or amount specifically of hGDMPLP proteins, as specific biomolecule
XX capture probes for surface-enhanced laser desorption/ionisation, as
XX therapeutic supplement in patients having specific deficiency in hGDMPLP-1
XX production, and in vaccines or for replacement therapy. The
XX polynucleotide sequences encoding hGDMPLP-1 may be used for diagnosing a
XX disorder associated with the expression of hGDMPLP-1, in particular heart
XX and skeletal muscle disorders. hGDMPLP-1 is localised to chromosome 22.
XX The present sequence represents an oligomer used in the screening of the
XX hGDMPLP-1 sequence in the exemplification of the present invention. N.B.

PS
XX The present invention describes a human genome-derived myosin-like
CC protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-

CC 1 can be used in gene therapy and vaccine production. The hGDMLP-1
CC nucleic acids can be used as probes to detect, characterise and quantify
CC hGDMLP-1 nucleic acids in samples, as amplification substrates, to
CC provide initial substrates for the recombinant engineering of hGDMLP-1
CC protein variants having desired phenotypic improvements, and for
CC expressing the proteins. The hGDMLP-1 proteins or polypeptides may be
CC used as immunogens to raise antibodies that specifically recognise hGDMLP
CC -1 proteins, as standards in assays used to determine the concentration
CC and/or amount specifically of hGDMLP proteins, as specific biomolecule
CC capture probes for surface-enhanced laser desorption ionisation, as
CC therapeutic supplement in patients having specific deficiency in hGDMLP-1
CC production, and in vaccines or for replacement therapy. The
CC polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a
CC disorder associated with the expression of hGDMLP-1, in particular heart
CC and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.
CC The present sequence represents an oligomer used in the screening of the
CC hGDMLP-1 sequence in the exemplification of the present invention. N.B.

XX New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins,
PT or as specific biomolecule capture probes for surface-enhanced laser
PT desorption/ionization, comprises human myosin-like protein hGDMLP-1.
XX

PS Disclosure; SEQ ID NO 8906; 214pp; English.
XX
CC The present invention describes a human genome-derived myosin-like
CC protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-
CC 1 can be used in gene therapy and vaccine production. The hGDMLP-1
CC nucleic acids can be used as probes to detect, characterise and quantify
CC hGDMLP-1 nucleic acids in samples, as amplification substrates, to
CC provide initial substrates for the recombinant engineering of hGDMLP-1
CC protein variants having desired phenotypic improvements, and for
CC expressing the proteins. The hGDMLP-1 proteins or polypeptides may be
CC used as immunogens to raise antibodies that specifically recognise hGDMLP-
CC -1 proteins, as standards in assays used to determine the concentration
CC and/or amount specifically of hGDMLP proteins, as specific biomolecule
CC capture probes for surface-enhanced laser desorption/ionisation, as
CC therapeutic supplement in patients having specific deficiency in hGDMLP-1
CC production, and in vaccines or for replacement therapy. The
CC polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a
CC disorder associated with the expression of hGDMLP-1, in particular heart
CC and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.
CC The present sequence represents an oligomer used in the screening of the
CC hGDMLP-1 sequence in the exemplification of the present invention. N.B.
CC The sequence data for this patent did not form part of the printed
CC specification, but was obtained in electronic format directly from WIPO
CC at ftp.wipo.int/pub/published_pct_sequence

 PS The present invention describes a trypsinogen, which is a protease (I)
 XX isolated from Engraulis japonicus (also called Engraulis japonica or
 CC Japanese anchovy). The present invention also describes: (1) a DNA
 CC encoding (I), or encoding a protease consisting of an amino acid sequence

CC in which part of the amino acid residue is replaced, inserted or deleted
 CC in the amino acid sequence encoded by the above DNA and having a bio-
 CC activity substantially same as (I); (2) an expression vector in which the
 CC above DNA is recombinant; (3) producing a sardine-derived protease in
 CC which a host cell transformed by the above expression vector is cultured
 CC and (I) is recovered; (4) a protease containing substantially no other
 CC protein derived from fish; and (5) the preparation of a fish sauce in a
 CC short period while inhibiting the generation of an unpleasant smell
 CC compared to a case where the protease prepared by the above method is not
 CC added in which at least one of a fish or a shellfish selected from the
 CC group consisting of Clupeidae order is immersed in an aqueous solution
 CC containing salts in as high salt concentration as about 8% to 24% and the
 CC protease prepared by the above method is added to it and fermented for
 CC about 1 to 11 months. The method is used for the preparation of a fish
 CC sauce in a short period. The present sequence represents a nucleotide
 CC sequence which is used in an example from the present invention

 XX
 CC The invention relates to an oligonucleotide for targeted alteration of a
 CC genetic sequence, which comprises a single-stranded oligonucleotide
 CC having a DNA domain. The DNA domain has at least one mismatch with
 CC respect to the genetic sequence to be altered and further comprises
 CC chemical modifications of the oligonucleotide. The chemical modifications

CC consist of o-methyl modification, an LNA modification, two or more
 CC phosphorothioate linkages on a terminus, or a combination of any two or
 CC more of these modifications. The oligonucleotides are useful for
 CC directing repair or alteration of plant genetic information. The
 CC oligonucleotides are particularly useful for creating plants with desired
 CC phenotypes, e.g. environmental or abiotic stress tolerance, improved
 CC nutritional value (e.g. altering amino acid content of plants or
 CC conferring amino acid over production), herbicide resistance (e.g.
 CC glyphosate resistance, imidazolinone and sulphonylurea herbicide
 CC resistance, porphyric herbicide resistance or triazine resistance),
 CC disease resistance, modified oil production, modified starch production
 CC (e.g. increased starch or production of waxy starch), altered floral
 CC morphology (e.g. male-sterile plants) or modified fatty acid content
 CC (e.g. reduced palmitate, increased stearate or reduced linolenic acid).
 CC The oligonucleotides are also useful for producing albino mutants for the
 CC analysis of photosynthetic processes. This sequence represents a genome
 CC altering oligonucleotide of the invention

 PT
 XX Example 2; Page 123; 718pp; English.
 PS
 XX The present invention relates to human testis expressed Patched like
 CC protein (HTPL, see ABV78759 to ABV78762 and ABV98519 to ABV98520). HTPL
 CC has two isoforms, with a few single base pair differences between the
 CC two. One of the single base pair changes introduces a premature stop
 CC codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL
 CC shares an overall structure organisation with the Patched protein. The
 CC shared structural features strongly imply that HTPL plays a role similar
 CC to that of Patched, and is a potential tumour suppressor. HTPL is
 CC important in regulating male germ cell development, and the HTPL gene was
 CC mapped to human chromosome 10p12.1. HTPL and its coding sequence are
 CC useful for diagnosing a disorder caused by mutation in HTPL, and in
 CC therapy and manufacture of a medicament for treatment or prevention of
 CC such disorder associated with decreased expression or activity of human
 CC HTPL. Such disorders include disorders of testis, or adrenal, adult and
 CC foetal liver, bone marrow, brain, kidney, lung, placenta, prostate,
 CC skeletal muscle or colon function. HTPL proteins and nucleic acids are
 CC clinically useful diagnostic markers and potential therapeutic agents for
 CC male infertility and cancer. The present oligonucleotide was used in an
 CC example from the invention

XX Novel polynucleotide which down regulates expression of Ets-related gene,

PT useful for treating cancer, diabetic retinopathy, macular degeneration,

PT arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome.

XX Claim 4; Page 59; 149pp; English.

XX The invention relates to a nucleic acid molecule (I) which down regulates

CC expression of an Ets-related gene (ERG). (I) is useful for treating

CC conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma,

CC tumour angiogenesis, diabetic retinopathy, macular degeneration,

CC neovascular glaucoma, myopic degeneration, arthritis, psoriasis, verruca

CC vulgaris, angiofibroma of tuberous sclerosis, port-wine stains, Sturge

CC Weber syndrome, Kippel-Trenaunay-Weber syndrome, Osier-Weber-rendu

CC syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for

CC treating a patient having a condition associated with the level of ERG,

CC by contacting cells of the patient with (I) under conditions suitable for

CC the treatment. The method comprises the use of one or more therapies

CC under conditions suitable for the treatment. Leukaemia or tumour

CC angiogenesis is treated by administering (I) to the patient in

CC conjunction with one or more of other therapies such as radiation or

CC chemotherapy treatment. (I) is useful for reducing ERG activity in a

CC cell, by contacting the cell with (I). (I) is useful for cleaving RNA of

CC ERG gene, by contacting (I) with RNA, in the presence of a divalent

CC cation such as Mg2+. (I) is useful for diagnosis of conditions and

CC diseases related to the expression of ERG, and as diagnostic tool to

CC examine genetic drift and mutations within diseased cells or to detect

CC the presence of ERG RNA in a cell. (I) is useful for specifically

CC targeting genes that share homology with ERG gene or ERG fusion genes.

CC ABK17354-ABK22719 represent nucleic acids, including antisense and

CC enzymatic nucleic acid molecules which regulate expression of ERG, and

CC related PCR primers of the invention

XX Novel cell having pre-trans-splicing molecules with target binding

PT domains that target binding of PTM to pre-mRNA, 3' or 5' splice region,

PT spacer region, nucleotide sequence to be trans-spliced to target-pre-

XX mRNA.

XX Example; Page 80; 229pp; English.

XX The present invention describes a cell (I) comprising pre-trans-splicing

CC molecules (PTMs) (II) which have one or more target binding domains (IIa)

CC that target binding of PTM to pre-mRNA, 3' splice region (IIb) that

CC includes branch point pyrimidine tract and 3' splice acceptor site, or 5'

CC splice site (IIc), spacer region (IId) that separates RNA splice site

CC from target binding domain, and nucleotide sequence to (Iie) be trans-

CC spliced to target-pre-mRNA. Optionally, the cell comprises (II) either

CC comprising: (A) (IIb) and (Iie); or (B) (IIc), (IId) and (Iie). The cell

CC may comprise a recombinant vector expressing (II). (I) has cytostatic,

CC immunosuppressive and antimicrobial activities, and can be used in gene

CC therapy. (II) comprising one or more (preferably two or more) (IIa) and

CC (IIb) (or (IIc)), (IId) and (Iie), or (II) comprising either (A) or (B)

CC (excluding IId), is useful for producing a chimeric RNA molecule in a

CC cell which involves contacting a target pre-mRNA expressed in the cell

CC with (II) that is recognised by nuclear splicing components. The chimeric

CC RNA produced comprises sequences encoding a toxin or translatable

CC protein. The nucleotide sequence to be trans-spliced to target pre-mRNA

CC preferably comprises nucleotide sequences comprising exons 1-10 of cystic

CC fibrosis trans-membrane conductance regulator (CFTR). The chimeric RNA

CC molecule produced using (II) which either comprises (A) or (B) further

CC comprises a nucleotide sequence tag. (I) can be used for gene regulation,

CC gene repair and targeted cell death. (I) can be used for the treatment of

CC various diseases including genetic, infectious or autoimmune diseases and

CC proliferative disorders such as cancer and to regulate gene expression in

CC plants. ABQ73414 to ABQ73536 represent sequences used in the

XX exemplification of the present invention

XX Identifying a subject as a candidate for a particular course of therapy
XX to treat a vascular disease or disorder, e.g. stroke, myocardial
XX infarction or ischemia by determining the identity of the nucleotide
XX present at specific positions.
XX Claim 64; Page 568; 568pp; English.
XX This invention describes a novel method for identifying a subject as a
XX candidate for a particular course of therapy to treat a vascular disease
XX or disorder. The method comprises determining the identity of the
XX nucleotide present at specific positions, or their complements, and
XX identifying the subject as a candidate for a particular clinical course
XX of therapy based on the identity of the nucleotide present in that
XX specific position. The method can be used for identifying a subject who
XX is a candidate for further diagnostic evaluation of a vascular disease or
XX disorder and selecting a clinical course of therapy. The products of the
XX invention have cardiant, antiarteriosclerotic and cerebroprotective
XX activity and can be used for gene therapy. The methods disclosed are
XX useful for treating a vascular disease, e.g. atherosclerosis, coronary
XX artery disease, myocardial infarction, ischaemia, stroke, peripheral
XX vascular diseases, venous thromboembolism and pulmonary embolism. The DNA
XX sequences are useful as fingerprint for detecting different individuals
XX within the same species applicable in forensic studies and paternity
XX testing. This sequence represents a primer used to illustrate the method
XX of the invention

PT New isolated nucleic acid, useful for treating viral diseases associated
PT with tumors and cell degeneration, also related polypeptides, antibodies
PT and transfected cells.
XX
PS Disclosure; Page 303; 720pp; French.
XX
XX The invention relates to a novel isolated 17 mer nucleic acid sequence,
CC given in the specification, a sequence containing at least 15 consecutive
CC nucleotides from the 17 mer sequence, a sequence with, after optimal
CC alignment, at least 80 % identity to the 17 mer sequence, a sequence that
CC hybridizes to them under highly stringent conditions, or the complement
CC of any of them, or the corresponding RNA. The novel isolated nucleic
CC acids of the invention are useful as probes and primers for detecting,
CC identifying, quantifying and/or amplifying a nucleic acid, e.g. as one
CC component of a gene chip, in vitro as (anti)sense reagents, and for
CC production of recombinant polypeptides. Any of the nucleic acids,
CC polypeptides, vectors containing the nucleic acids, cells containing the
CC vector or antibodies directed against the polypeptides are useful for
CC preparation of pharmaceuticals for prevention and/or treatment of viral
CC diseases that are characterised by development of tumours or cell
CC degeneration, specifically cancer but also Alzheimer's disease and
CC schizophrenia. Analysis of the expression of the 17 mer nucleic acids in
CC patient samples is useful for diagnosis and/or prognosis of these
CC diseases. The polypeptides can also be used to generate antibodies, and
CC both the polypeptide and antibodies are useful as components of protein
CC chips. The nucleic acid sequences of the invention can be used in gene
CC therapy. This polynucleotide sequence represents a tumour suppression

XX
XX Novel enzymatic nucleic acid molecules which down regulates expression of
PT a sequence encoding a subunit of nuclear factor kappa B useful for
PT treating cancer, inflammatory disorders and autoimmune diseases.
XX
XX Claim 3; Page 34; 72pp; English.
XX
XX The invention describes an enzymatic nucleic acid molecule (I) which down
CC regulates expression of a sequence encoding a subunit of nuclear factor
CC kappa B (NFkB), where (I) is an inozyme, zinzyme, G-cleaver or amberzyme
CC configuration. The enzymatic nucleic acid molecule is adapted to treat
CC cancer and is useful for down-regulating REL-A activity in a cell, for
CC treating a patient having a condition associated with the level of REL-A.
CC (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in
CC the presence of a divalent cation, especially Mg2+. The enzymatic and
CC antisense nucleic acid molecules are useful for treating breast, lung,
CC prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic,
CC cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or
CC therapies such as monoclonal antibodies, the method involves use of other drug
CC chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate,
CC cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate,
CC gemcitabine or radiation therapy. The enzymatic and antisense nucleic
CC acid molecules are also useful for treating inflammatory disease such as
CC rheumatoid arthritis, restenosis, asthma, Crohn's disease, diabetes,
CC obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft
CC rejection, gene therapy applications, ischaemia/reperfusion injury
CC (central nervous system (CNS) and myocardial), glomerulonephritis,
CC sepsis, allergic airway inflammation, inflammatory bowel disease or
CC infection. This sequence represents the substrate of a novel enzymatic
CC nucleic acid molecule

XX
XX The present invention relates to novel human zinc finger-containing
CC proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is
CC encoded at chromosome 7q22.1, MDZ4 is encoded at chromosome 6p21.3-22.2,
CC MDZ7 is encoded at chromosome 16p11.2 and MDZ12 is encoded at chromosome
CC 15q26.1. The MDZ3, MDZ4, MDZ7, and MDZ12 sequences are useful in therapy,
CC or in manufacturing a medicament for treating or preventing a disorder,
CC associated with decreased or increased expression or activity of MDZ3,
CC MDZ4, MDZ7, or MDZ12, e.g. cancer or developmental disorders. The nucleic
CC acids and proteins are also useful for diagnosing or monitoring a disease
CC caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic
CC acids can also be used as probes to detect and characterize gross
CC alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are
CC useful in constructing microarrays for measuring gene expression. The
CC proteins are useful as therapeutic agents for gene therapy or as
CC vaccines. The present sequence was used to illustrate the invention.

XX PT Novel compound useful for treating cirrhosis, liver failure,
XX PT hepatocellular carcinoma, or condition associated with hepatitis C virus
XX PT infection.
XX PS Example 1; Page 149; 387pp; English.
XX CC The present invention relates to nucleic acid molecules which modulate
XX CC the synthesis, expression and/or stability of Hepatitis C virus (HCV) or
XX CC Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense
XX CC and enzymatic nucleic acids such as hammerhead ribozymes, DNazymes,
XX CC inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed
XX CC are nucleic acid decoy molecules and aptamers that bind to HBV reverse
XX CC transcriptase and/or HBV reverse transcriptase primer sequences, as well
XX CC as oligonucleotides that specifically bind the Enhancer I region of HBV
XX CC DNA. The nucleic acids may be used to modulate the expression of HBV
XX CC genes and HBV viral replication. Also disclosed is a method for screening
XX CC compounds and/or potential therapies directed against HBV, and compounds
XX CC that modulate the expression and/or replication of HCV. The compounds and
XX CC methods of the invention are useful for the treatment of degenerative and
XX CC disease states related to HBV and HCV infection, replication and gene
XX CC expression such as cirrhosis, liver failure, and hepatocellular
XX CC carcinoma. The present sequence represents a substrate for one of the HBV
XX CC ribozyme, inozyme, G-cleaver, zinzyme, DNazyme or amberzyme sequences
XX CC disclosed in the present invention

XX
XX The present invention relates to an oligonucleotide composition
XX comprising a first and second synthetic cooperative oligonucleotides
XX linked to their respective binding partner consisting of cyclodextrin,
XX adamantane, streptavidin, or biotin. Each oligonucleotide has a region
XX complementary to a tandem, non-overlapping region of a target nucleic
XX acid that is separated by 0-3 bases. The oligonucleotide composition is
XX useful as a pharmaceutical composition to inhibit the expression of
XX nucleic acids in vitro, or for treating a mammal infected by HIV or by
XX acquired immunodeficiency syndrome (AIDS). The cooperative
XX oligonucleotides have improved sequence specificity for a single-stranded
XX target, reduced toxicity, and improved biological activity as antisense
XX molecules. The present sequence represents a cooperative oligonucleotide
XX of the invention.

 XX
 CC The invention relates to the isolation of 6327 nucleotide sequences,
 CC fragments of at least 15 consecutive nucleotides of these nucleotides, a
 CC sequence having at least 80% identity, after optimal alignment, with the
 CC nucleotides, a sequence that hybridizes under stringent conditions with
 CC the nucleotides, or the complement, or corresponding RNA, of the
 CC nucleotides. The nucleotides are used as probes or primers for detecting,
 CC identifying, quantifying and/or amplifying nucleic acids, as in vitro
 CC sense and antisense sequences, of nucleotides involved in tumour
 CC suppression or reversion, apoptosis and or viral resistance, to produce
 CC recombinant polypeptides, and to prepare transgenic animals, as
 CC experimental models. The nucleotides (also vectors containing them and
 CC cells containing the vectors), the encoded polypeptides and antibodies
 CC (Ab) against the polypeptide are useful for prevention and/or treatment
 CC of viral infections or diseases characterized by development of tumours
 CC or cell degeneration (e.g. Alzheimer's disease or schizophrenia).
 CC Analysis of the expression of the nucleotides can be used for diagnosis
 CC and/or prognosis of these diseases. The nucleotides and polypeptides can
 CC also be used to screen for their specific interactive molecules,
 CC potentially useful for treating diseases associated with abnormal
 CC expression of the nucleotides.

 DR New nucleic acid encoding human prostate membrane-specific antigen, useful e.g. for treatment of tumors and viral infection, also related polypeptide and antibodies.
 XX Disclosure; Page 307; 771pp; French.
 PS The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a

CC sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides, or the complement, or corresponding RNA, of the nucleotides. The nucleotides are used as probes or primers for detecting, identifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them and cells containing the vectors), the encoded polypeptides and antibodies (Ab) against the polypeptide are useful for prevention and/or treatment of viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease or schizophrenia). Analysis of the expression of the nucleotides can be used for diagnosis and/or prognosis of these diseases. The nucleotides and polypeptides can also be used to screen for their specific interactive molecules, potentially useful for treating diseases associated with abnormal expression of the nucleotides.

XX Novel human GTP-activator protein for Rab-like GTPase and polynucleotide
 PT encoding the protein, useful for diagnosing, treating or preventing
 PT disorders associated with increased expression or activity of the
 PT protein.

PS Example 2; SEQ ID NO 33; 149pp; English.

XX The invention relates to an isolated human GTP-activator protein for Rab-
 CC like GTPase (GAPN) polypeptide (I), a sequence having 65% identity to
 CC (I), a sequence in which at least 95% of deviations from (I) are
 CC conservative substitutions, or a fragment of at least 8 contiguous amino
 CC acids of (I). The polypeptide is useful for identifying a specific
 CC binding partner for itself, by contacting the polypeptide in vivo to a
 CC potential binding partner and determining if the polypeptide binding
 CC partner binds to the polypeptide (I) and a nucleic acid encoding the
 CC polypeptide (II) are useful for diagnosing or monitoring a disease caused
 CC by altered expression of GAPN, by determining the level of expression of
 CC GAPN in a sample of nucleic acids or proteins that derives from a subject
 CC suspected to have the disease, alterations from a normal level of
 CC expression providing diagnostic and/or monitoring information. (I), (II)

CC or agonist of (I) is useful for treating or preventing a disorder
CC associated with decreased expression or activity of GAPN, and an
CC antagonist of (I) is useful for treating or preventing a disorder
CC associated with increased expression or activity of GAPN (all claimed).
CC (I) is useful as immunogen to raise antibodies that specifically
CC recognize GAPN proteins. (II) is useful to drive in vivo expression of
CC GAPN proteins, and as hybridization probes to detect, characterize and
CC quantify GAPN nucleic acids in and isolate GAPN nucleic acids from both
CC genomic and transcript-derived nucleic acid samples. This sequence
CC represents a 17-mer oligonucleotide spanning the GAP_N DNA sequence.

XX Concurrent interrogation of a number of polymorphic sites, useful for

XX genetic testing, carrier screening, genetic profiling, and identity

XX testing, comprises conducting a multiplexed elongation assay using

XX probes.

XX Example 9; Page 48; 143pp; English.

XX This invention relates to a novel method for the concurrent interrogation
 of a number of polymorphic sites in the presence of, and without
 interference from, non-designated polymorphic sites. Specifically, it
 comprises conducting a multiplexed elongation assay by applying one or
 more temperature cycles to achieve linear amplification of the target or
 a combination of annealing and elongation steps under temperature-
 controlled conditions. Furthermore, this detection method uses probe
 extension or elongation and relies on enzymatic recognition, a superior
 technique that no longer depends on differential hybridisation. The
 present invention describes probes and methods useful for identifying or
 detecting polymorphisms at one or more designated sites, such that they
 can identify mutations within the cystic fibrosis conductance
 transmembrane regulator (CFTR) or the human leukocyte antigen (HLA)
 genes. In addition, concurrent interrogation of a multiplicity of
 polymorphic sites is useful for genetic testing, carrier screening,
 genotyping or genetic profiling, and identity testing. This
 oligonucleotide is a human probe used for the elongation mediated
 CC multiplexed analysis of HLA-B, in an exemplification of the invention.

XX	PT	reducing wt. in treatment of diabetes, high blood pressure and high	
XX	PT	cholesterol and for cosmetic reasons.	
XX	XX		
XX	PS	Example 10; Page 142; 304pp; English.	
XX	XX		
XX	CC	AAT16392-T16429 represent amplification primers for the human obesity	
XX	CC	polypeptide (OBP) gene sequence (see AAT16373). These sequences were used	
XX	CC	to amplify the OBP gene sequence from the YAC contig containing the human	
XX	CC	OBP gene, in a series of sequence tagged-site (STS)-specific PCR assays.	
XX	CC	There were 19 STSs found within the YAC contig human OBP gene sequence.	
XX	CC	This sequence was used in conjunction with AAT16429 to amplify the STS	
XX	CC	sWSS2367. OBP has effects on both food intake and energy expenditure. OBP	
XX	CC	and its analogues are useful for modifying body weight (optionally	
XX	CC	combined with known medicaments), for treating diabetes, high blood	
XX	CC	pressure or high cholesterol. The OBP coding sequence (and sequences	
XX	CC	complementary to it) can be used in gene therapy for modifying body	
XX	CC	weight. The protein can be used for reducing weight for health or	
XX	CC	cosmetic reasons in obese humans, or to produce leaner food animals.	
XX	CC	Antagonists of OBP (including antibodies) are useful for increasing body	
XX	CC	weight, e.g. for treating weight loss associated with cancer, or for	
XX	CC	cosmetic reasons in humans, or for production of Kobe beef or Foie gras	
XX	CC	in domestic animals. OBP antibodies (Ab) can also be used in diagnostic	
XX	CC	immunoassays for the presence of OBP. The formation of Ab-OBP complexes	
XX	CC	enables in vitro evaluation of levels of OBP in a sample, especially to	
XX	CC	detect diseases associated with elevated or decreased levels, and to	
XX	CC	monitor treatment of these diseases

XX	PT	useful for preventing or treating initial development, progression or	
XX	PT	regression of vascular diseases, esp. familial hypercholesterolaemia.	
XX	PS	Claim 4; Page 57; 72pp; English.	
XX	XX		
XX	CC	AAT50699-T50754 represent target sequences for the rabbit cholesterol	
XX	CC	ester transfer protein (CERP) hairpin ribozymes (see AAT50643-T50698).	
XX	CC	CERP is a 74 kD glycoprotein that facilitates neutral lipid transfer	
XX	CC	between plasma lipoproteins. The numbering of the targets refers to the	
XX	CC	position of the cleavage site in full length CERP. The ribozyme then	
XX	CC	binds to 4-6 nucleotides 5', and a variable number 3' of this site. The	
XX	CC	ribozymes are able to cleave mRNA from the gene encoding CERP, thereby	
XX	CC	blocking synthesis and/or expression of the mRNA. By inhibiting CERP, the	
XX	CC	reverse cholesterol transport (RCT) pathway can be inhibited (or	
XX	CC	eliminated) thereby preventing the reduction in size density of the high	
XX	CC	density lipoproteins (HDL), prolonging HDL half life, and therefore	
XX	CC	increasing HDL levels. The ribozymes can be used to treat conditions	
XX	CC	associated with abnormal levels of CERP, specifically atherosclerosis,	
XX	CC	peripheral vascular disease, hyperbetalipoproteinaemia, dyslipidaemia,	
XX	CC	familial hypercholesterolaemia, hypoalphalipoproteinaemia, vascular	
XX	CC	complications of diabetes, transplant, atherectomy and angioplastic	
XX	CC	restenosis. By inhibiting CERP, the levels of HDL and low density	
XX	CC	lipoproteins (LDL), and the HDL:LDL ratio are favourably altered (a	
XX	CC	decrease in LDL levels, and a corresponding increase in HDL levels). The	
XX	CC	ribozymes can also be used diagnostically to study genetic drift and	
XX	CC	mutations in diseased cells, and to detect CERP mRNA. As the ribozymes	
XX	CC	target specific regions of the CERP gene, they have low non-specific	
XX	CC	activity

XX WSX receptor and related antibodies and ligands - used to develop
PT products for diagnosis and therapy, e.g. for improving haematopoiesis or
PT for treating tumours.
XX Example 8; Fig 7; 219pp; English.
XX The present sequence is the antisense oligonucleotide -20 for the human
CC WSX receptor cDNA. The receptor can be used to identify and purify
CC ligands and activators. An anti-WSX receptor antibody can be used as an
CC agonist to activate the WSX receptor, leading to enhanced proliferation
CC or differentiation of a cell expressing the WSX receptor. It can also be
CC used to decrease body weight and/or fat-depot weight and/or food intake
CC in an obese mammal. WSX receptor ligands can be used to enhance
CC proliferation or differentiation of lymphoid, myeloid or erythroid blood
CC cell lineages. This is useful when a mammal, especially a human, is
CC suffering from decreased blood cell levels, i.e. anaemia, caused by
CC chemotherapy, radiation therapy or bone marrow transplantation therapy.
CC It can also be used to repopulate blood cells in a mammal. The products
CC can also be used to treat, e.g. neoplastic disorders, arteriosclerosis,
CC osteoarthritis, polycystic ovarian disease, cardiovascular diseases,
CC resistance, hypercholesterolaemia, hypertriglyceridaemia, cancer and
CC cholelithiasis

XX Treatment of airway diseases such as asthma - by topically applying
PT adenosine-free antisense oligonucleotide to airway epithelium of
PT subject.
XX Example 5; Page 27; 71pp; English.
XX A method for treating airway disease in a subject has been produced,
CC which involves the topical administration of an essentially adenosine
CC free antisense oligonucleotide (ON) to the airway epithelium of the
CC subject. The present sequence is an antisense oligonucleotide specific
CC for the human eosinophil major basic protein. The method can be used to
CC treat airway diseases such as cystic fibrosis, asthma, chronic
CC obstructive pulmonary disease, bronchitis and other airway diseases
CC characterised by an inflammatory response. By eliminating adenosine from
CC the antisense ON, its liberation upon antisense degradation is prevented,
CC thereby preventing adenosine- induced bronchoconstriction in patients
CC with hyper-reactive airways

XX
DR WPI; 1998-400910/35.
XX
XX Preparation of antisense oligonucleotide(s) which lack long runs of
PT consecutive guanine or inosine - and have specific ratio of residues
PT able to form two or three hydrogen bonds, have greater activity and
PT reduced toxicity, used therapeutically or to modulate growth of cells in
PT culture.
XX
XX Example 2; Fig 4b; 286pp; English.
XX
XX AAV48485-564 represent antisense oligonucleotides directed against the
CC p53 gene. Of these, only oligonucleotides AAV48485-517 resulted in
CC effective downregulation of negative growth by p53 and increased cell
CC proliferation, while AAV48518-64 had little effect. The oligonucleotides
CC exemplify the invention. The specification describes oligonucleotides
CC that contain 8-30 nucleotides, which contain at most 8 nucleotides that
CC can each form three hydrogen bonds to cytosine; do not contain four
CC consecutive nucleotides able to form three H-bonds each to four
CC consecutive cytosines; do not contain two sequences of three consecutive
CC nucleotides each able to form three H-bonds to three consecutive
CC cytosines, and the ratio between residues able to form two H-bonds each
CC (2R) or three such bonds (3R) is given by 2R/3R = 0.33-0.72. The
CC oligonucleotides are used to modulate expression of genes, particularly
CC the genes for p53, ERBB-2, jumb, jund, TGF-beta 1 or beta 2 to control
CC proliferation of primary cell cultures (e.g. bone marrow stem, liver or
CC kidney cells, osteoclasts, osteoblasts and/or keratinocytes). The
CC oligonucleotides can also be used to analyse function of proteins (by
CC altering their expression or activity) and therapeutically, e.g. in cases
CC of cancer or (targeting TGF) for stimulating the immune system

XX New nucleic acid encoding specific protein tyrosine phosphatases - useful
PT for identifying specific modulators for treatment and prevention of
PT cancer and neurodegenerative disease.
PT
XX
XX Example 6; Page 86; 193pp; English.
XX
XX The present invention describes isolated, enriched or purified nucleic
CC acids encoding PTP04, SAD, PTP05, PTP10, ALP and ALK-7 proteins. The
CC above proteins, other than ALK-7, are protein tyrosine phosphatases
CC (PTPs) and are used to identify substances that modulate their activity
CC (i.e. agonists and antagonists, including NBP) in vivo or in vitro. These
CC substances are used to treat or prevent diseases associated with abnormal
CC signal transduction pathways that involve the proteins, particularly
CC cancer (e.g. leukaemia and lymphoma), while modulators of ALK-7 (which is
CC a type I receptor serine/threonine kinase) are used to promote neuronal
CC survival, particularly for treating Alzheimer's, Parkinson's or
CC Huntington's diseases. Nucleic acid fragments of the polynucleotides
CC encoding the proteins can be used as probes to identify and clone related
CC sequences; to detect protein-encoded RNA; to generate transgenic animals
CC and in gene therapy (optionally after mutation). Ab are used to determine
CC the proteins. The present sequence represents a RACE primer for human SAD

 XX Chlamydia trachomatis derived primers and probes - used for the specific
 PT detection of the microbe with nucleic acid amplification and strand
 FT displacement reactions.
 XX
 XX Claim 7; Col 17; 12pp; English.
 XX
 XX The present sequence represents a nucleic acid primer used in amplifying
 CC the Chlamydia trachomatis ltuB gene. The nucleic acid is used for the
 CC detection of Chlamydia trachomatis by nucleic acid amplification,
 CC especially by thermophilic strand-displacement amplification. The
 CC detection of Chlamydia trachomatis is used to diagnose trachoma,
 CC inclusion conjunctivitis, infant pneumonitis, urethritis and
 CC lymphogranuloma venereum, which are all caused by the microbe. The
 CC product obtained is the C. trachomatis ltuB gene, which is responsible
 CC for production of specific mRNA transcripts produced in the infectious
 CC stage of the microbe

XX Identifying compounds which modulate expression of nucleic acids, used to
 PT provide compounds having defined physical, chemical or bioactive
 PT properties, e.g. antisense activity.
 XX

XX Example 18; Page 97; 264pp; English.

XX A method has been developed of defining a set of compounds that modulate
 CC the expression of a target nucleic acid (tNA) sequence via binding of the

CC compounds with the tNA sequence. The method comprises generating a
 CC library of virtual compounds in silico according to defined criteria, and
 CC evaluating in silico the binding of the virtual compounds with the tNA
 CC according to defined criteria. Also described are: (1) a method of
 CC defining a set of oligonucleotides (ONS) that modulate the expression of
 CC a tNA sequence via binding of the ONS with the tNA sequence comprising
 CC generating a library of virtual compounds in silico according to defined
 CC criteria, and evaluating in silico the binding of the virtual ONS with
 CC the tNA according to defined criteria; and (2) a method of defining a set
 CC of compounds that modulate the expression of a tNA sequence via binding
 CC and identification of synthetic compounds having defined physical,
 CC chemical or bioactive properties. Information gathered from assays of
 CC such compounds is used to identify nucleic acid sequences that are
 CC tractable to a variety of nucleotide sequence-based technologies, e.g.
 CC antisense drug discovery and target validation. AAZ40852 to AAZ41220, and
 CC AA52701 to AA52706, represent sequences used in the exemplification of
 CC the present invention

 XX New agents for the blockade of inducible cAMP early repressor (ICER) -
 PT mediated inhibition of immune cell activity.
 XX Example 26; Fig 23; 113pp; English.
 XX This is the nucleotide sequence used as a control for an investigation
 CC into the possible role of Inducible cAMP Early Repressor (ICER) in Fas
 CC ligand gene expression. ICER may be involved in downregulating the
 CC activity of a wide variety of genes involved in stimulating the immune
 CC response. In particular, ICER binds to a number of recognition sites
 CC present in the promoters of genes encoding cytokines critical to the
 CC immune response. The agent which decreases the level of ICER expression
 CC can be used in the preparation of a medicament for increasing the
 CC activity of an immune cell. This is useful for the treatment of an
 CC individual suffering from a condition which reduces immune cell activity.
 CC Such conditions include cancer and infection with a pathogenic organism.
 CC There is a need for therapeutic strategies which prevent or reduce
 CC downregulation of the host immune response such as outlined in this
 CC invention. For example, cancer cells may induce the production of
 CC prostaglandin E 2 (PGE 2) in neighbouring normal host cells such as
 CC macrophages. PGE 2 inhibits the proliferation of T cells, therefore
 CC reducing the ability of the host immune system to destroy the cancer
 CC cells

 PT e.g. cancer, cardiac and autoimmune disorders and infectious diseases and
 PT for developing contraceptives.
 XX
 PS Example 3; Page 98; 110pp; English.

XX The invention provides a human soluble protein ZTMPO-1 which has homology
CC to the thymopoietin-emerin family of nuclear membrane proteins. The ZTMPO
CC -1 protein can be expressed by standard recombinant methodology. Altered
CC levels of ZTMPO-1 receptor polypeptides may be indicative of pathological
CC conditions including cancer, cardiac and autoimmune disorders and
CC infectious diseases. The nucleic acid can be used as a source of
CC hybridization probes for detecting a genetic abnormality in a patient.
CC The ZTMPO-1 polypeptides can be used to modulate cellular proliferation
CC and differentiation in a diverse array of tissues such as testis,
CC skeletal muscle, thyroid and adrenal gland. Antagonists of ZTMPO-1 can be
CC used in modulating cellular proliferation and differentiation such as in
CC tumor growth and development. They can also be used for inhibiting
CC spermatogenesis and sperm activation. Such ZTMPO-1 antagonists can be used
CC for contraception in humans and animals, and in particular, domestic and
CC zoological animals and livestock, where they would act to prevent
CC fertilization of an egg. ZTMPO-1 antagonists could also be used to
CC mediate immune response, e.g. by boosting the humoral response in
CC individuals at risk for an infectious disease or as a supplement to
CC vaccination. The present sequence represents a primer specific for the
CC ZTMPO-1 DNA, used in mapping of the gene

PT bronchitis, emphysema, respiratory distress syndrome, ischemia or
PT cancers.

Claim 18; Page 454; 1343pp; English.

XX The present invention describes a new composition comprising an antisense
CC oligonucleotide (ON) with low adenosine (up to 15%), which targets
CC nucleic acids involved in bronchoconstriction, allergies, and/or
CC inflammation. The ON can have antiinflammatory, antiallergic,
CC antiasthmatic, cytotostatic and analgesic activities. The compositions are
CC useful for the treatment of diseases associated with inflammation,
CC impaired airways, including lung disease and diseases whose secondary
CC effects afflict the lungs of a subject. They can be used for treating
CC e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma,
CC impeded respiration, respiratory distress syndrome, pain, cystic
CC fibrosis, pulmonary hypertension, emphysema, chronic obstructive
CC pulmonary disease (COPD), and cancers such as leukaemias, lymphomas,
CC carcinomas, and cancers which may metastasize to the lungs, including
CC breast and prostate cancer. The reduction of the adenosine content of the
CC ONs reduces side effects. The A-containing ONs break down with the
CC release of deoxyadenosine which activates adenosine receptors causing
CC bronchoconstriction and inflammation. AAA32313 to AAA35312 represent the
CC nucleotide sequences given in the sequence listing from the present
CC invention, which correspond to SEQ ID NO:1 to 2815, and then the last 185
CC sequences are also called SEQ ID NO:1 to 185, but the sequences differ
CC from the previously named sequences. SEQ ID NO:11 to 1680 (AAA32323 to
CC AAA33992) are specifically claimed ONs from the present invention. N.B.
CC Sequences given in the disclosure of the present invention do not match
CC up with their corresponding SEQ ID NO: sequences given in the sequence
CC listing

 XX
 XX Antisense compounds which inhibit the expression of the human NF-kappa-B
 PT p65 subunit (p65) useful for treating diseases associated with p65
 PT expression and as prophylaxis to prevent of delay infection, inflammation
 PT or tumor formation.
 XX
 XX Example 15; Col 41; 33pp; English.
 PS
 XX The present sequence is one of a number of oligonucleotides designed to
 CC target different regions of the human NF-kappa-B p65 subunit, which is a
 CC member of the Rel/NF-kappa-B family of transcription factors. Rel/NF-
 CC kappa-B proteins are involved in a diverse set of signaling pathways
 CC involving stress, apoptosis, cancer, growth, infection and inflammation.
 CC Antisense oligonucleotides are able to inhibit expression of the p65
 CC subunit and may therefore be used in the treatment of disorders
 CC associated with NF-kappa-B p65 subunit expression. They may be used as a
 CC prophylaxis to prevent or delay infection, inflammation or tumor
 CC formation. Antisense compounds may also be used for research and
 CC diagnostics because they hybridise to nucleic acids encoding NF-kappa-B
 CC p65 subunit. The effect of antisense oligonucleotides on NF-kappa-B p65
 CC subunit mRNA levels was measured using real-time quantitative PCR and
 CC Northern blot analysis. Antisense oligonucleotides were synthesised on an
 CC automated DNA synthesiser

 PT adenosine receptors during metabolism, useful e.g. for treating cancers
 PT and respiratory obstructions.
 PT
 XX Claim 14; Page 260; 1592pp; English.
 PS
 XX The present invention describes low adenosine (A) content antisense
 CC oligonucleotides and compositions (I) comprising them. In the antisense
 CC oligonucleotides the A is replaced by a 'Universal' or alternative base.
 CC (I) can have respiratory, bronchodilator, antiinflammatory, analgesic,
 CC immunosuppressive, antiasthmatic, hypotensive and cytostatic activities.
 CC The antisense oligonucleotides and (I) can be used to down-regulate the
 CC expression and or activity of target polypeptides associated with
 CC lung/respiratory disorders and malignancies, such as stimulating and
 CC activating peptide factors and transmitters, transcription factors,
 CC immunoglobulins and antibodies, antibody receptors, cytokines and
 CC chemokines, endogenously produced specific and non-specific enzymes,
 CC binding proteins, adhesion molecules and their receptors, cytokine and
 CC chemokine receptors, adenosine receptors, bradykinin receptors, central
 CC nervous system (CNS) and peripheral nervous and non-nervous system
 CC receptors, CNS and peripheral nervous and non-nervous system peptide
 CC transmitters, defensins, growth factors, vasoactive peptides and
 CC receptors, binding proteins and malignancy associated proteins. The
 CC antisense oligonucleotides may be used in this way to treat disorders
 CC including respiratory obstruction (especially pulmonary obstruction
 CC and/or bronchoconstriction) and/or lung inflammation, allergy(ies) and/or
 CC surfactant hypoproduction which are associated with a disease or
 CC condition selected from pulmonary vasoconstriction, inflammation,
 CC allergies, asthma, impeded respiration, respiratory distress syndrome
 CC (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary

 XX Low adenosine (A) content antisense oligonucleotides which do not trigger
 PT adenosine receptors during metabolism, useful e.g. for treating cancers
 PT and respiratory obstructions.
 XX Claim 14; Page 257; 1592pp; English.
 XX The present invention describes low adenosine (A) content antisense
 CC oligonucleotides and compositions (I) comprising them. In the antisense
 CC oligonucleotides the A is replaced by a 'Universal' or alternative base.
 CC (I) can have respiratory, bronchodilator, antiinflammatory, analgesic,
 CC immunosuppressive, antiasthmatic, hypotensive and cytostatic activities.
 CC The antisense oligonucleotides and (I) can be used to down-regulate the
 CC expression and or activity of target polypeptides associated with
 CC lung/respiratory disorders and malignancies, such as stimulating and
 CC activating peptide factors and transmitters, transcription factors,
 CC immunoglobulins and antibodies, antibody receptors, cytokines and
 CC chemokines, endogenously produced specific and non-specific enzymes,
 CC binding proteins, adhesion molecules and their receptors, cytokine and
 CC chemokine receptors, adenosine receptors, bradykinin receptors, central
 CC nervous system (CNS) and peripheral nervous and non-nervous system
 CC receptors, CNS and peripheral nervous and non-nervous system peptide
 CC transmitters, defensins, growth factors, vasoactive peptides and
 CC receptors, binding proteins and malignancy associated proteins. The
 CC antisense oligonucleotides may be used in this way to treat disorders
 CC including respiratory obstruction (especially pulmonary obstruction
 CC and/or bronchoconstriction) and/or lung inflammation, allergy(ies) and/or
 CC surfactant hypoproduction which are associated with a disease or
 CC condition selected from pulmonary vasoconstriction, inflammation,
 CC allergies, asthma, impeded respiration, respiratory distress syndrome
 CC (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary
 CC hypertension, emphysema, chronic obstructive pulmonary disease (COPD),
 CC pulmonary transplantation rejection, pulmonary infections, bronchitis,
 CC and/or cancer. AAF18434 to AAF21543 represent human polynucleotide
 CC fragments and antisense oligonucleotides used in the exemplification of
 CC the present invention

 XX Antibodies specific for PRO polypeptides, used to diagnose and inhibit
 PT the growth of tumors in mammals, and to identify inhibitors of PRO
 PT polypeptide activity or expression.
 XX Example 20; Page 123; 236pp; English.
 XX The present invention describes an antibody that binds to a human protein
 CC (I) selected from: PRO381; PRO1269; PRO1410; PRO1755; PRO1780; PRO3434;
 CC PRO1927; PRO3567; PRO1293; PRO1303; PRO1303; PRO4344; PRO4397;
 CC PRO4407; PRO1555; PRO1096; PRO2038; and PRO2262. (I) has anticancer
 CC activity and can be used to diagnose tumours in mammals, by detecting
 CC complex formation when the antibody is contacted with test cells.
 CC Increased expression of genes encoding (I) can also be detected to
 CC diagnose tumours. Agents which inhibit the activity of (I), especially
 CC the antibodies, or an antisense oligonucleotide which hybridises to genes
 CC encoding (I), can be used to inhibit tumour growth, preferably by
 CC inducing cell death. Methods from the present invention can be used to
 CC identify compounds which inhibit the biological activity of (I). AAC58019
 CC to AAC58102 represent PCR primers and hybridisation probes used in
 CC examples from the present invention for human PRO sequences. AAC58103 to
 CC AAC58122 and AAB24021 to AAB24040 represent human PRO polynucleotide and
 CC protein sequences given in the exemplification of the present invention

XX PT Novel antibody to mammalian obesity polypeptide useful for diagnosis and
XX PT treatment of weight loss associated with disorders such as cancer, AIDS
XX PT and anorexia nervosa.
XX PS Example 10; Col 81-82; 150pp; English.
XX CC The present sequence is a PCR primer which was used in an invention
XX CC relating to the control of body weight of animals including humans.
XX CC Antibodies against the mammalian obesity (OB) polypeptide have been
XX CC identified. The antibodies are useful for modulating the activity of OB
XX CC to control body weight and fat content and/or to treat certain
XX CC pathological conditions in which there is abnormal depression or
XX CC elevation of body weight. The antibodies are used to treat weight loss
XX CC associated with cancer, AIDS and anorexia nervosa. They are useful for
XX CC the diagnosis of nutritional disorders such as obesity and diseases
XX CC associated with obesity, such as hypertension, heart disease and Type II
XX CC diabetes. The kits are used to determine the presence or amount of OB in
XX CC the blood or plasma of an individual

XX PT New polynucleotide encoding prolactin regulatory element binding protein
XX PT useful for treating osteoporosis, cancer and autoimmune diseases.
XX PS Example; Page 57; 87pp; English.
XX CC The specification describes a prolactin regulatory element binding (PREB)
XX CC protein. The protein is a kinase-mediated hormonal regulator of prolactin
XX CC gene expression, i.e. a transcription factor. The protein binds to the 1p
XX CC element of the prolactin promoter. PREB proteins are useful for treating
XX CC osteoporosis. PREB modulators are useful for treating cancer, autoimmune
XX CC diseases by inhibiting the expression of prolactin. PREB antisense
XX CC sequences are also useful for treating a development defect. Inhibition
XX CC of prolactin gene expression is useful for inhibiting graft-versus-host
XX CC diseases in transplantations. PREB polynucleotides are useful as a probe
XX CC for diagnosing trisomy 2p in a subject. PCR primers AAA75984-87 were used
XX CC to amplify a human PREB gene fragment

PT stimulating an immune response in a patient having an adenocarcinoma,
PT especially useful for treating colorectal, breast, lung or prostate
PT cancer.
XX PS Example 1; Page 50; 131pp; English.
XX CC The invention relates to a composition for stimulating an immune response
CC in a patient having an adenocarcinoma or colorectal cancer. The
CC composition comprises an allogeneic tumour cell selected from SW620 cell,
CC COLO 205 cell and SW403 cell, and a physiological carrier. The allogeneic

```

CC cell stimulates an immune response to an autologous tumour cell in the
CC patient. The composition is useful for stimulating an immune response in
CC a patient having an adenocarcinoma, e.g. colon, breast, lung or prostate
CC adenocarcinoma. The use of allogeneic tumour cells provides a generic
CC source of antigen that can be administered to a variety of patients, in
CC contrast to using autologous tumour cells, which must be isolated from
CC each individual patient. The allogeneic cells are suitable as a cancer
CC vaccine and can stimulate an immune response against autologous tumour
CC cells of a cancer patient. The present sequence represents the reverse
CC PCR primer used in gene expression analysis of tumour antigen MAGE-4

XX
CC This invention relates to an antisense compound targeted to a nucleic
CC acid molecule encoding a member of the human Rho family of small GTP
CC binding proteins, where the antisense compound inhibits the expression of
CC the member of the human Rho family. The invention includes antisense
CC oligonucleotides AAF94580 - AAF94637 which target a RhoA nucleotide
CC sequence, AAF94645 - AAF94684 which target a RhoB nucleotide sequence,
CC AAF94686 - AAF94725 which target a RhoC nucleotide sequence, AAF94727 -
CC AAF94766 which target RhoG nucleotide sequence, AAF94769 - AAF94790 which
CC target a Rac 1 nucleotide sequence and AAF94795 - AAF94809 which target
CC cdc42 nucleotide sequence. The antisense compound is useful for treating
CC hyperproliferative conditions, especially cancer, abnormal wound healing
CC or clotting conditions and ischaemia/reperfusion or reoxygenation injury.
CC The compound may also be used to diagnose the above conditions

XX
XX
CC The present invention describes a method of arraying genome clones. The
CC method comprises: (a) clones of the genomic libraries contained in
CC multiwell plates numbered for discrimination are mixed in each of the
CC multiwell plates; (b) a primer designed based on the chromosome marker
CC sequence is added to the mixture to carry out an amplification reaction;
CC (c) a signal corresponding to the marker is detected from the resultant
CC amplified product to specify the discrimination Nos. of the multiwell
CC plates containing the clones having said marker sequence; (d) the order
CC of the markers is changed so that the same discrimination Nos. succeed to
CC the maximum in the specified discrimination Nos. to array the multiwell
CC plates; (e) the clones in the multiwell plates of the specified
CC discrimination Nos. are mixed respectively in each wells of longitudinal
CC and lateral directions; (f) the mixed clones are cultured and the
CC resultant cultures are amplified by using the above primer; (g) signals
CC are detected from the amplified products; (h) the clones in the multiwell
CC plates are specified from the detected result; and (i) the clones are
CC reconstituted as the positions on the chromosome and arrayed. The
CC microarray is useful for gene analysis. ABL42957 to ABL45322 represent

PT Novel nucleic acids encoding retina-specific human protein C7orf9,
PT C12orf7, MPP4 or F379, useful for diagnosing age-related macular
PT degeneration or predisposition for macular degeneration, and in gene
PT therapy techniques.
XX

XX Example 1; Page 32; 120pp; English.

CC The invention relates to isolated nucleic acid encoding retina-specific
CC human protein C7orf9, C12orf7, MPP4 or F379 or a fragment, derivative or
CC allelic variation of the above mentioned nucleic acid sequences. Also
CC included are a recombinant vector containing the nucleic acid, a
CC recombinant host cell which contains the vector and expresses the
CC protein, an inhibitor characterised in that it can suppress the activity
CC of the protein, treating macular degeneration or a predisposition for
CC macular degeneration, comprising administering to a mammalian subject a
CC reagent which decreases, inhibits or increases expression of C7orf9,
CC C12orf7, MPP4 and/or F379 or which leads to the expression of a
CC biologically active C7orf9, C12orf7, MPP4 and/or F379 protein and a
CC transgenic non-human animal comprising at least one of the nucleic acids
CC (active or inactivated). The nucleic acid or protein is useful for
CC diagnosing macular degeneration, preferably age-related macular
CC degeneration (AMD) or a predisposition for macular degeneration. The
CC reagent used in the diagnosis is a C7orf9-, C12orf7-, MPP4- or F379 -
CC specific nucleic acid probe, or anti-C7orf9, anti-C12orf7, anti-MPP4 or
CC anti-F379-antibody. The reagent is detectably labeled, with a compound
CC such as a radioisotope, a bioluminescent compound, a chemiluminescent
CC compound, a fluorescent compound, a metal chelate or an enzyme. Fragments
CC of the nucleic acid are useful as probes or primers in a diagnostic

CC assay, and for identifying further factors involved in development and
 CC progression of macular degeneration. The proteins encoded by the nucleic
 CC acid are useful to identify further unrelated proteins which are
 CC associated with macular degeneration and for use in screening methods
 CC based on protein/protein interactions. The nucleic acid is also useful as
 CC reagents for detecting differences between normal and aberrant expression
 CC of the protein. The nucleic acid is also useful in gene therapy
 CC techniques, and can be used for gene targeting and/or gene replacement
 CC for restoring a mutant gene or for creating a mutant gene via homologous
 CC recombination. The protein can be used to identify other proteins.
 CC involved in development and progression of macular degeneration. The
 CC present sequence is a reverse transcriptase (RT)-PCR primer used to
 CC isolate or study DNA corresponding to a retina specific protein of the
 CC invention

 PT New obese polypeptide useful for inducing reduction of body weight in an
 PT animal, for preparing a composition for treating obesity, disease
 PT associated with obesity such as hypertension, heart disease or type II
 PT diabetes.
 XX
 XX Example 10; Page 44; 144pp; English.
 PS
 XX The invention relates to an obese (ob) polypeptide, also known as leptin,
 CC expressed predominantly by adipocytes and capable of inducing reduction
 CC of body weight in an animal. The polypeptide is useful for monitoring
 CC therapeutic treatment of a disease associated with elevated or decreased
 CC levels of ob polypeptide in a mammalian subject; for use in
 CC radioimmunoassays for measuring fat and/or plasma levels of ob protein or

CC for detecting the presence and level of receptor for ob on tissues, such
 CC as hypothalamus; for screening expression libraries to isolate active
 CC receptors; for use in cosmetics by improving body appearance by reducing
 CC fat deposits or appetite or both and is used independently or in
 CC conjugation with other cosmetic strategies e.g. surgery for its cosmetic
 CC effect; for identifying agonists or antagonists that affect its activity
 CC and has potential agricultural uses e.g. increasing the body weight of
 CC animals. Nucleic acid encoding the polypeptide is useful for identifying
 CC mutation in ob nucleotide, in gene therapy for obesity and in the
 CC measurement of its encoded RNA and protein in nutritional disorders. A
 CC host cell transfected with a vector expressing the polypeptide is useful
 CC in the preparation of modulators of the polypeptide and its nucleic acid.
 CC An immunogenic fragment of the polypeptide is useful for preparing an
 CC antibody. The antibody is useful for measuring the presence of the
 CC polypeptide in a sample; for evaluating the level of ob polypeptide in a
 CC biological sample to detect or diagnose the presence of a disease
 CC associated with elevated or decreased levels of ob polypeptide in a
 CC mammalian subject; for imaging ob polypeptide in situ. A composition
 CC comprising the polypeptide is useful for reducing body weight of an
 CC animal, in particular humans. A composition comprising an antagonist of
 CC the polypeptide is useful for increasing body weight of an animal.
 CC Compositions containing the polypeptide and the antagonist are useful for
 CC treating obesity, weight loss associated with cancer or AIDS, disease
 CC associated with obesity such as hypertension, heart disease or type II
 CC diabetes. The present sequence represents a human sequence tagged
 CC specific PCR primer

PS Example 3; Col 57; 40pp; English.

XX This invention relates to the cDNA and protein sequences of a novel

CC isolated ZTMPO-1 polypeptide. ZTMPO-1 is a soluble protein with homology

CC to the nuclear membrane proteins emerin and thymopoietins. The protein of

CC the invention may have immunosuppressive, inotropic, cardiant,

CC cytotstatic, antidiabetic and hypotensive activities. The invention also

CC comprises antibodies to ZTMPO-1 proteins which can be used to detect

CC ZTMPO proteins and may be used to regulate the function of the protein.

CC The sequences of the invention may be used for modulating cellular

CC proliferation and differentiation, and for diagnostic purposes. The

CC polypeptides can be used to treat immunological, reproductive, cardiac,

CC and muscle pathologies, such as diabetes, muscular dystrophy,

CC haematopoietic disorders, leukaemias, and hypertension. The present

CC sequence represents a human ZTMPO-1 gene specific primer used in

CC chromosomal mapping of the ZTMPO gene of the invention

CC used to map the location of the ZTMPO-1 gene to chromosome 12q24.3 in the

CC invention. The method of the invention comprises determining the presence

CC of an alteration in the nucleic acid sequence of a polynucleotide

CC encoding the ZTMPO-1 protein. Primers or probes derived from the human

CC ZTMPO-1 polynucleotide sequence or a susceptibility to a neurological

CC disease e.g. Alzheimer's disease. ZTMPO-1 probes and primers can also be

CC used to detect and to localise ZTMPO-1 gene expression in tissue samples.

CC ZTMPO-1 gene probes can also be used to detect aberrations and

CC alterations e.g. aneuploidy. Gene copy number changes, restriction site

CC changes and rearrangements. The ZTMPO-1 genes and probes comprising ZTMPO

CC -1 DNA can also be used to determine if the ZTMPO-1 gene is present on

CC chromosome 12 or if there is a chromosomal structural abnormality

CC associated with that region. The ZTMPO-1 polypeptides and polynucleotides

CC may be used within diagnostic systems to detect ZTMPO-1 polypeptides or

CC ZTMPO-1 polynucleotides in biological sample and which serves as a

CC diagnostic tool for diseases that are associated with altered levels of

CC ZTMPO-1 polynucleotides or polypeptides

XX Identifying KAR-associated protein-transduced immune signal inhibitor,

XX comprises using cells co-expressing functional KARAP, and engineered

XX cells and animals that over-express functional KARAP or bear non-

XX functional KARAP.

XX Example 1; Page 20; 89pp; English.

XX The present invention relates to a novel method for identifying compounds

XX capable of inhibiting KAR-associated protein (KARAP)-transduced immune

XX signals. The method involves using functional and non-functional KARAP,

XX cells co-expressing functional KARAP, functional receptors transducing

XX their signal by zeta, gamma or epsilon and engineered cells and animals

XX over-expressing functional KARAP or bearing non-functional KARAP. The

XX method is useful for identifying compounds capable of inhibiting KARAP-

XX transduced immune signals. The KARAP-inhibiting compounds are useful for

XX impairing the development and maturation of dendritic cells, for

XX inhibiting the antigen presentation of dendritic cells, by synthesis

XX inhibition or through inhibition of the migration of dendritic cells, for

XX making drugs intended for inhibiting dendritic cell development or

XX maturation, for preparing drugs for the treatment, prevention, palliation

XX of immune response, where the activation of KAR has to be inhibited and

XX for the treatment of contact sensitivity or multiple sclerosis. The

XX present DNA sequence is KARAP/DAP12 specific reverse transcription (RT)-

XX PCR primer. This sequence is used in the exemplification of the invention

XX Designing capture oligonucleotide probes for use on a support to which

XX complementary oligonucleotides hybridize with little mismatch.

XX Example 3; Page 65; 300pp; English.

XX The present invention describes a method (M1) for designing capture

XX oligonucleotide probes (I) for use on a support to which complementary

XX oligonucleotide probes (II) will hybridize with little mismatch, where

XX (I) have melting temperatures within a narrow range. The method is useful

XX for detecting infectious diseases caused by bacterial infectious agents

XX e.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal

XX infectious agents e.g. Cryptococcus neoformans, Candida albicans and

XX Aspergillus fumigatus, viruses e.g. T-cell lymphocytotropic virus,

XX Epstein-Barr virus and polio virus, and parasitic infectious agents

XX selected from Onchocerca volvulus, Entamoeba histolytica and Dracunculus

XX medinensis. The method is also useful for detecting genetic diseases such

XX as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.

XX Detecting cancer involving oncogenes, tumour suppressor genes, or genes

XX involved in DNA amplification, replication, recombination or repair, the

XX cancer is specifically associated with a gene selected from BRCA1 gene,

XX p53 gene, human papillomavirus types 16 and 18 and liver cancers. The

XX method is also used for environmental monitoring, forensics and the food

XX and feed industry, detecting comprises scanning (using e.g. a scanning

XX electron microscope and infrared microscope) the support at the

XX particular sites and identifying if ligation of the oligonucleotide probe

XX sets occurred and correlating (using a computer) identified ligation to a

XX presence or absence of the target nucleotide sequences. ABI82074 to

 XX PT Pharmaceutical composition for treating ailments associated with impaired
 XX PT respiration, has oligo(s) antisense to specific gene(s) or its
 XX PT corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
 XX PT ubiquinone.
 XX PS
 XX PS Disclosure; SEQ ID NO 10891; 872pp; English.
 XX CC The invention relates to a novel pharmaceutical composition, which has a
 CC first active agent comprising an oligonucleotide antisense to the
 CC initiation codon, coding region, 5' or 3' end genomic flanking regions,
 CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of
 CC junctions of genes encoding a polypeptide associated with lung and/or
 CC nasal airway dysfunction and a second active agent comprising an
 CC antiinflammatory steroid and ubiquinone. A composition of the invention
 CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive,
 CC immunosuppressive, and cytostatic activity. The composition may have a
 CC use in antisense gene therapy. The composition is useful for treating or
 CC preventing a respiratory, lung or malignant disease or condition, also
 CC for enhancing the prophylactic or therapeutic respiratory effect of an
 CC antiinflammatory steroid in a subject, for reducing or depleting levels
 CC of, or reducing sensitivity to adenosine, reducing levels of adenosine
 CC receptor, producing bronchodilation, increasing levels of ubiquinone or
 CC lung surfactant in a subject's tissue, or treating bronchoconstriction,
 CC lung inflammation, lung allergies, or a respiratory disease or condition.
 CC Note: The sequence data for this patent is not represented in the printed
 CC specification, but was obtained in electronic format directly from WIPO

 XX PT Novel homozygous stem cell useful for making desired progenitor cells,
 XX PT differentiated cells, group of differentiated cells, and tissue types.
 XX PS Example 3b; Page 26; 49pp; English.
 XX CC The invention describes an isolated homozygous stem cell (HS). HS is
 CC derived by producing a mitotically activated homozygous post-meiosis I
 CC diploid germ cell (I) by fusing two oocytes or two spermatids, culturing
 CC (I) to form a blastocyst-like mass, and isolating HS from the inner cell
 CC mass of the blastocyst-like mass. HS is useful for making a desired
 CC progenitor cell, differentiated cell, group of differentiated cells, or
 CC tissue type, by inducing HS to differentiate under suitable conditions.
 CC The differentiation is accomplished by the inclusion of a cell regulating
 CC factor, hormone or cytokine in the culture medium. The desired cell or
 CC group of cells is keratinising epithelial cells, epithelial absorptive
 CC cells of the gut, exocrine glands, urogenital tract, epithelial cells
 CC serving as the lining the lung, gut, exocrine glands, or urogenital tract
 CC or as a barrier, and epithelial cells lining closed internal body
 CC cavities, ciliated cells with propulsive function, contractile cells,
 CC cells of the blood and immune system, sensory transducers, autonomic
 CC neurons, supporting cells of sense organs and of peripheral neurons, and
 CC neurons or glial cells of central nervous system, lens cells, pigment
 CC cells, germ cells, and nurse cells, or one of the embryonic germ layers
 CC comprising the ectoderm, endoderm or mesoderm. Progenitor cells are
 CC useful in a therapy to treat a disease or condition selected from
 CC Parkinson's, Huntington's, Alzheimer's, amyotrophic lateral sclerosis
 CC (ALS), spinal cord defects or injuries, multiple sclerosis, muscular
 CC dystrophy, cystic fibrosis, liver disease, diabetes, heart disease,
 CC cartilage defects or injuries, burns, foot ulcers, vascular disease,
 CC urinary tract disease, AIDS and cancer. This sequence represents a
 CC reverse transcriptase PCR primer used to analyse hepatic cell specific
 CC gene expression while studying the differentiation of HS cells into
 CC hepatic cells

XX Producing homozygous stem cells for transplantation or cell replacement
XX therapy, by isolating homozygous stem cells from a blastocyst-like mass
XX or from a stemplasm created by transplanting the blastocyst-like mass
XX into animal hosts.
XX Example 3; Page 28; 49pp; English.
XX The invention relates to a method for producing homozygous stem cells,
XX comprising isolating homozygous stem cells from the inner cell of a
XX blastocyst-like mass or transplanting a blastocyst-like mass into an
XX animal host to create a stemplasm, which is cultured in vitro to derive
XX homozygous stem cell lines. The method is useful for producing isolated
XX homozygous stem cells, which are also useful for diagnosing or treating
XX diseases, e.g. genetic diseases, neurodegenerative diseases (such as
XX Alzheimer's disease or multiple sclerosis), endocrine-related disorders,
XX cancers, diabetes, liver diseases, heart diseases, or immune defects. The
XX homozygous stem cells are also useful in cosmetic or therapeutic
XX transplantation, gene therapy, cell replacement therapy or in treating
XX traumatic injuries (e.g. limb replacement, spinal cord injury or burns).
XX These cells are useful for generating cells, masses of cells, tissues or
XX organs for transplantation. This sequence represents an RT-PCR primer
XX used to amplify mouse alpha-fetoprotein (AFP) DNA, used in the scope of
```

XX Tailor-made pluripotent stem cells for production of donor organs and
XX tissues which do not induce immune rejection when transplanted.
XX Example 2; Page 92; 172pp; Japanese.
XX The invention relates to a method of generating tailor-made pluripotent
XX stem cells having a desired genome, in which the MHC (major
XX histocompatibility) antigens are reduced or absent. This sequence
XX represents a primer used in the method of the invention. The invention
XX also includes methods for the preparation of the pluripotent stem cells,
XX by producing modified stem cells in which the MHC antigens are reduced or
XX absent, then fusing the cells with reprogrammed somatic cells having the
XX desired genome, and removing the genomic material originating from the
XX stem cells. The tailor-made pluripotent stem cells may be used in the
XX production of cells, tissues and organs for transplantation to treat
XX disease conditions in the recipient, without inducing immune rejection

 PT New human or mouse OB polypeptide, also referred to as leptin
 PT polypeptide, which is capable of modulating body weight, useful for
 PT treating obesity.
 XX
 XX Example 10; Col 79-80; 153pp; English.
 PS
 XX The invention describes an OB (obese) polypeptide (also referred as
 CC leptin) (1), capable of modulating body weight, comprising amino acids 22
 CC - 167 of a human or mouse OB polypeptide sequence of 167 amino acids
 CC (S1), given in the specification, or amino acids 22 - 166 a human or
 CC mouse OB polypeptide sequence of 166 amino acids (S2), given in the
 CC specification. The OB polypeptide is useful for reducing body weight in
 CC conditions of obesity, and as a target for neutralising antibodies which
 CC results in weight gain (protein therapy), for treating weight loss
 CC associated with cancer, acquired immunodeficiency syndrome (AIDS) or
 CC anorexia nervosa. This sequence represents a primer associated with the
 CC isolation of the human obese (ob) or leptin gene

XX
XX New WSX receptor, useful for preparing a composition for treating
PT diseases mediated by WSX receptor e.g., diabetes or obesity.
XX
XX Example 8; Fig 7; 142pp; English.
PS
XX
XX The invention relates to an isolated leptin/WSX receptor comprising a
CC sequence of mature human WSX receptor variant 12.1. Also disclosed are
CC the 13.2 and 6.4 WSX receptor variants (and DNA molecules encoding all 3
CC proteins), a partial mouse WSX receptor and its encoding DNA sequence.
CC The WSX receptor is useful for preparing a composition for treating
CC diseases mediated by WSX receptor, especially diseases characterised by a
CC decrease in haematopoietic cells, e.g., anaemia, thrombocytopaenia,
CC hypoplasia, disseminated intravascular coagulation (DIC), myelodysplasia,
CC immune (autoimmune) thrombocytopaenic purpura (ITP), and HIV induced ITP.
CC The WSX receptor is also useful for treating metabolic disorders such as
CC anorexia, obesity (e.g. steroid-induced truncalobesity) tumours such as
CC stem cell tumours, inflammatory conditions, iron deficiency, diabetes,
CC renal failure, conditions related to haematopoietic cell proliferation
CC (such as in bone marrow transplantation and for promoting kidney, lung
CC and liver growth and/or repair. An experiment was performed to show
CC antisense inhibition of human and mouse WSX receptors. The present
CC sequence is an antisense oligonucleotide used in the experiment

DR
XX
XX New WSX receptor, useful for preparing a composition for treating
PT diseases mediated by WSX receptor e.g., diabetes or obesity.
XX
XX Example 8; Fig 7; 142pp; English.
PS
XX
XX The invention relates to an isolated leptin/WSX receptor comprising a
CC sequence of mature human WSX receptor variant 12.1. Also disclosed are
CC the 13.2 and 6.4 WSX receptor variants (and DNA molecules encoding all 3
CC proteins), a partial mouse WSX receptor and its encoding DNA sequence.
CC The WSX receptor is useful for preparing a composition for treating
CC diseases mediated by WSX receptor, especially diseases characterised by a
CC decrease in haematopoietic cells, e.g., anaemia, thrombocytopaenia,
CC hypoplasia, disseminated intravascular coagulation (DIC), myelodysplasia,
CC immune (autoimmune) thrombocytopaenic purpura (ITP), and HIV induced ITP.
CC The WSX receptor is also useful for treating metabolic disorders such as
CC anorexia, obesity (e.g. steroid-induced truncalobesity) tumours such as
CC stem cell tumours, inflammatory conditions, iron deficiency, diabetes,
CC renal failure, conditions related to haematopoietic cell proliferation
CC (such as in bone marrow transplantation and for promoting kidney, lung
CC and liver growth and/or repair. An experiment was performed to show
CC antisense inhibition of human and mouse WSX receptors. The present
CC sequence is a sense (control) oligonucleotide used in the experiment

PT of the polypeptide, and for treating or preventing cancer.
XX
XX Example C; SEQ ID NO 210; 478pp; English.
XX
XX The invention relates to a novel isolated NOV polypeptide. The
CC polypeptide of the invention demonstrates cytostatic activity and may be
CC used for determining the presence of, or predisposition to a disease
CC associated with altered levels of expression of the polypeptide,
CC including metabolic disorders, immune disorders, neurodegenerative
CC disorders, circulatory diseases, haemopoietic disorders, wasting diseases
CC and cancer. The polypeptide may also be utilised during gene therapy
CC procedures, vaccine development and transgenic animal production. The
CC current sequence is that of the PCR primer of the invention which was
CC used to analyse human NOV DNA.

XX Detecting and differentiating cytosine methylation state of genomic DNA,
PT useful for diagnosing, treating prognosticating and/or monitoring lung
PT cell proliferative disorders e.g. adenocarcinoma and squamous cell
PT carcinoma.
XX
XX Claim 15; SEQ ID NO 852; 58pp; English.
XX
XX This invention relates to a novel method for detecting and
CC differentiating between lung cell proliferative disorders associated with
CC at least one gene and/or their regulatory regions. Specifically, it
CC refers to a method comprising contacting a target nucleic acid in a
CC biological sample with at least one reagent, wherein the reagent is able
CC to distinguish between methylated and non-methylated CpG dinucleotides
CC present in the target DNA. As such, it is possible to further

CC differentiate and diagnose medical conditions including adenocarcinoma
 CC and squamous cell carcinoma, and their respective adjacent lung tissue.
 CC The present invention describes cytosine oligomers and PNA-oligomers
 CC that are useful as probes for determining the cytosine methylation state
 CC of single nucleotide polymorphisms (SNPs) of the target sequence. This
 CC oligonucleotide sequence is a primer oligomer used for the analysis of
 CC CpG positions within genomic DNA, used in an exemplification of the
 CC invention.

 PT Novel agonist antibody useful for activating WSX receptor and for
 PT enhancing proliferation or differentiation of a cell comprising WSX
 PT receptor, which specifically binds to the WSX receptor.
 XX
 PS Example 8; SEQ ID NO 33; 140pp; English.

CC The invention relates to agonist antibodies which specifically bind to
 CC the human WSX receptor. The agonist antibodies are useful for activating
 CC the WSX receptor and for enhancing proliferation or differentiation of a
 CC cell comprising the WSX receptor, by exposing the cell to an antibody.
 CC The antibodies are also useful for reducing weight, specifically in the
 CC treatment of obesity, bulimia and other disorders associated with
 CC abnormal expression or functions of WSX receptor genes, for treating
 CC metabolic disorders such as diabetes, for reducing excessive levels of
 CC insulin in human patients and for treating patients suffering from food
 CC consumption and related pathological conditions such as type II adult
 CC onset diabetes, infertility, hypercholesterolaemia, hyperlipidaemia,
 CC cardiovascular diseases, arteriosclerosis, polycystic ovarian disease,
 CC osteoarthritis, dermatological disorders, insulin resistance,
 CC hypertriglyceridaemia, cancer, cholelithiasis and hypertension. The

CC antibodies are also useful for treating kidney ailments, lung
 CC dysfunctions such as emphysema, haemorrhages, diseases characterised by
 CC decrease in blood cells such as anaemia, thrombocytopenia, hypoplasia,
 CC metabolic disorders such as cachexia, anorexia and loss of appetite, and
 CC other tumour related disorders. This sequence represents a human WSX
 CC receptor DNA antisense oligonucleotide.

 PT Novel agonist antibody useful for activating WSX receptor and for
 PT enhancing proliferation or differentiation of a cell comprising WSX
 PT receptor, which specifically binds to the WSX receptor.
 XX
 PS Example 8; SEQ ID NO 34; 140pp; English.
 XX
 CC The invention relates to agonist antibodies which specifically bind to
 CC the human WSX receptor. The agonist antibodies are useful for activating
 CC the WSX receptor and for enhancing proliferation or differentiation of a
 CC cell comprising the WSX receptor, by exposing the cell to an antibody.
 CC The antibodies are also useful for reducing weight, specifically in the
 CC treatment of obesity, bulimia and other disorders associated with
 CC abnormal expression or functions of WSX receptor genes, for treating
 CC metabolic disorders such as diabetes, for reducing excessive levels of

CC insulin in human patients and for treating patients suffering from food
 CC consumption and related pathological conditions such as type II adult
 CC onset diabetes, infertility, hypercholesterolaemia, hyperlipidaemia,
 CC cardiovascular diseases, arteriosclerosis, polycystic ovarian disease,
 CC osteoarthritis, dermatological disorders, insulin resistance,
 CC hypertriglyceridaemia, cancer, cholelithiasis and hypertension. The
 CC antibodies are also useful for treating kidney ailments, lung
 CC dysfunctions such as emphysema, haemorrhages, diseases characterised by
 CC decrease in blood cells such as anaemia, thrombocytopenia, hypoplasia,
 CC metabolic disorders such as cachexia, anorexia and loss of appetite, and
 CC other tumour related disorders. This sequence represents a human WSX
 CC receptor DNA antisense oligonucleotide.

XX Novel isolated PRO polypeptides e.g. PRO1491 and PRO1571, useful in the
PT preparation of a medicament for treating a condition responsive to PRO
PT polypeptide, and as therapeutic agents e.g. vaccines.
XX Example 143; SEQ ID NO 453; 555pp; English.
PS

XX The invention relates to human PRO polypeptides and the polynucleotides
CC encoding them. The sequences are useful in the preparation of a
CC medicament for treating a condition responsive to a PRO polypeptide. The
CC polypeptides are useful in a number of functional biological assays, as
CC molecular weight markers for protein electrophoresis and as therapeutic
CC agents. The polynucleotides are useful as hybridisation probes for a cDNA

PT New nucleic acid encoding a new human endothelial polypeptide designated
PT EG-1, useful for diagnosing and treating angiogenesis-associated disease
PT such as heart disease, stroke and cancer.
XX
PS Claim 1; SEQ ID NO 9; 54pp; English.

CC The invention relates to an isolated nucleic acid comprising a nucleic
CC acid sequence that specifically hybridises to a human endothelial-derived
CC gene-1 (EG-1) cDNA or encodes a human EG-1 polypeptide. Also included are
CC a polypeptide encoded by EG-1 whose expression is upregulated in an
CC endothelial cell, a cell transfected with an EG-1 nucleic acid, an
CC antibody that binds to EG-1 protein, screening for an agent that
CC modulates tissue angiogenesis or tumorigenesis, a transgenic animal
CC comprising a recombinantly modified EG-1 gene so that the gene does not
CC transcribe a functional EG-1 protein, identifying a predisposition to
CC developing symptoms of a disease characterised by abnormal angiogenesis
CC and inhibiting angiogenesis comprising inhibiting expression or activity
CC or an EG-1 gene product. The invention is used to diagnose and treat
CC angiogenesis related disease such as heart disease, stroke and cancer.
CC The effects of EG-1 inhibition using anti-EG-1 antibodies or EG-1
CC peptides (ADC73363 - ADC73367) was examined. Antibodies against all these
CC sequences were used. Interference with antibodies or peptide fragments
CC caused inhibition in endothelial cell proliferation, increase in
CC apoptosis, and inhibition of endothelial migration and tube formation,
CC assayed using standard techniques. The present sequence is a PCR primer

CC used to amplify EG-1 cDNA.

XX
XX Novel isolated PRO polypeptide, useful for treating cancerous tumors,
PT cardiac insufficiency disorders, wound healing, diabetes mellitus,
PT thalassemias.
XX
XX Example 143; SEQ ID NO 453; 556pp; English.
XX
CC The invention relates to an isolated PRO polypeptide (secreted or
CC transmembrane protein) having at least 80% amino acid sequence identity
CC to an amino acid sequence chosen from 123 fully defined sequences as
Query Match 4.1%; Score 11.8; DB 1; Length 18;

XX DR WPI; 2003-786999/74.
XX Novel isolated PRO polypeptide useful for tissue typing, modulating
PT biological activity of cell, as molecular weight markers in protein
PT electrophoresis, for treating arthritis, tumor.
XX Example 143; SEQ ID NO 453; 550pp; English.
XX The invention relates to an isolated PRO polypeptide (secreted or
CC transmembrane protein) having at least 80% amino acid sequence identity

Query Match 4.1%; Score 11.8; DB 1; Length 18;

XX
XX PT New oligonucleotides, useful for rapid detection of beer-spoilage
XX bacteria by in situ hybridization, are specific for type, genus or
XX species.
XX
XX PS Claim 1; SEQ ID NO 258; 88pp; German.
XX
XX CC This invention describes novel oligonucleotides used in a method for
XX detecting beer-spoilage bacteria in a sample. The bacteria detected
XX include lactic acid bacteria of the genera Lactobacillus or Pediococcus,
XX especially the species L. coryniformis, L. perolens, L. buchneri, L.
XX plantarum, L. fructivorans, L. lindneri, L. casei, L. brevis or P.
XX damnosus or Gram-negative bacteria of the genera Pectinatus and M.
XX cerevisiae. The oligonucleotides of the invention provide rapid detection
XX of spoilage bacteria (typically within 48 hours, compared with 7-12 days
XX for conventional culture methods), can detect all relevant bacteria in
XX parallel, can differentiate between species of the same genus, and are
XX easy to use. ADE14806-ADE15247 represent the oligonucleotides used in the
XX method of the invention.

PS Claim 30; SEQ ID NO 522; 448bp; English.

XX The invention relates to a method of detecting and differentiating between lymphoid cell proliferative disorders associated with at least one gene and/or their regulatory regions in a subject by contacting a target nucleic acid in a biological sample obtained from the subject with at least one reagent or series of reagents that distinguish between methylated and non-methylated CpG dinucleotides within the target nucleic acid. The genes and/or their regulatory regions are preferably selected from MDR1, CSNK2B, BGR4, AR, CDK4, RB2, CDC25A, GFI1b, MYO1, CDH3, MYCL1, ELK1, ABL1, APC, BCL2, CDH1, CDKN1A, CDKN1B, CDKN2a, FOS, GSTP1, HIC-1, MGMT, MLH1, MOS, MYC, PTEN, RBL2, TGFBR2, TP73, CDKN1C, GSK3beta, ESR1, APAF1, BAK1, BAX or HOXA5. Oligomers, peptide nucleic acid (PNA)-oligonucleotides or isolated nucleic acids based on the sequences of the genes are useful for detecting the methylation state of all the CpG dinucleotides within one or more of the sequences, or their complements, for determining the cytosine methylation state and/or single nucleotide polymorphisms (SNPs), and for differentiating at least two of the medical conditions such as diffuse large B-cell lymphoma, mantle cell lymphoma, chronic lymphocytic leukemia, small lymphocytic lymphoma and follicular lymphoma. They are also useful for detecting of a predisposition to, differentiation between subclasses, diagnosis, prognosis, treating and/or monitoring of lymphoid cell proliferative disorder. This sequence represents an oligonucleotide used to analyse of CpG positions within the above mentioned genes.

DR Set of oligonucleotides, useful for diagnosis and cell typing, is
PT designed to detect single-nucleotide polymorphisms and cytosine
PT methylation status.
XX Claim 1; SEQ ID NO 131451; 29pp + Sequence Listing; German.
XX This invention describes novel oligonucleotide primers or peptide nucleic
CC acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP)
CC and cytosine methylation status in chemically pretreated genomic DNA. The
CC oligonucleotides are used for diagnosis and/or prognosis of cancer and a
CC range of diseases including immune system, gastrointestinal, respiratory,
CC central nervous system, cardiovascular and metabolic disorders. The
CC oligomers are also used for detecting cell type differentiation. ABC00010

 XX New haplotypes of the FK506-binding protein 8 gene, useful for genotyping
 PT that gene in individual and to design new therapy for associated disease
 PT such as immunosuppression and cancer.
 XX Claim 15; Page 79; 98pp; English.
 XX The invention relates to haplotyping the FK506-binding protein 8 (38kD)
 CC (FKBP8) gene in an individual. The method involves determining the
 CC identity of the nucleotide pair at one or more polymorphic sites selected
 CC from P1 to P26 (described in the specification). The invention is useful
 CC to improve the efficiency and reliability of several steps in the
 CC discovery and development of drugs for treating diseases associated with
 CC FKBP8 activity, for example immunosuppression and cancer. Sequences
 CC AAI67300-351 represent allele-specific oligonucleotide (ASO) primers for
 CC detecting FKBP8 gene polymorphisms. Note: some of these sequences
 CC (alternate sequence id numbering- 31, 33, 35, .81) differ from those with
 CC the same seq id No.s indicated in the disclosure

 XX PT Novel isolated human electron-transfer-flavoprotein, beta polynucleotide,
 XX PT useful for therapeutic purposes, for studying the expression and function
 XX PT of the polynucleotide, and for expressing the flavoprotein.
 XX PS Claim 17; Page 14; 143pp; English.
 XX CC The invention comprises DNA, cDNA and protein sequences of the human
 CC electron-transfer flavoprotein, beta polypeptide (ETFB) gene (located on
 CC chromosome 19q13.3-13.4). The invention specifically relates to the
 CC identification of 27 novel polymorphic sites within the ETFB gene.
 CC Electron-transfer flavoprotein (ETFB) is an obligatory electron acceptor
 CC for nine primary flavoprotein dehydrogenases and is located in the
 CC mitochondrial matrix. ETF is composed of an alpha (ETFA) and a beta
 CC (ETFB) subunit. Electrons accepted by ETF are transferred to the
 CC mitochondrial respiratory chain by ETF dehydrogenases (ETFDHS).
 CC Deficiency of ETF or ETFDH leads to glutaric acidemia type II (GAI1).
 CC Therefore ETFB is a pharmaceutically-important gene in the treatment of
 CC GAI1. The novel ETFB polymorphisms identified in the invention are useful
 CC for genotyping and haplotyping the ETFB gene of an individual. The ETFB
 CC protein and nucleic acids of the invention are useful for studying the
 CC expression and function of ETFB in vivo. The ETFB protein and nucleic
 CC acids are also useful for testing the efficacy of therapeutic agents and
 CC compounds for glutaric acidemia type II. The nucleic acids of the
 CC invention are useful in the production of a transgenic animal expressing
 CC the ETFB gene. Nucleic acids ABL39414-ABL39440 represent claimed ETFB
 CC allele-specific probes. Nucleic acids ABL39441-ABL39494 represent claimed
 CC ETFB allele-specific PCR primers. Nucleic acids ABL39495-ABL39548
 CC represent claimed ETFB primer-extension oligonucleotides

 XX Novel genetic variants of 5-Hydroxytryptamine (Serotonin) Receptor 5A
 PT isogenes, useful for improving efficiency and reliability in drug
 PT development for treating neurological diseases.
 XX Claim 17; Page 14; 134pp; English.
 XX The invention relates to single nucleotide polymorphisms in the gene
 CC encoding human 5-hydroxytryptamine (serotonin) receptor 5A (HTR5A). A
 CC method for haplotyping the HTR5A gene in an individual comprises
 CC identifying the nucleotide at one or more polymorphic sites and
 CC determining whether one of the copies of the gene is defined by one of
 CC the HTR5A haplotypes given in the specification or whether both copies
 CC are defined by a haplotype pair. This method is useful in genotyping,
 CC whereby all possible haplotype pairs can be assigned to specific
 CC genotypes. An association between a trait and a haplotype or haplotype
 CC pair of the HTR5A gene can be identified by comparing the frequency of
 CC the haplotype or haplotype pair in a population exhibiting the trait with
 CC the frequency of the haplotype or haplotype pair in a reference
 CC population, where a higher haplotype frequency in the trait population
 CC indicates the trait is associated with the haplotype or haplotype pair.
 CC HTR5A and its corresponding DNA are used for studying the expression and
 CC function of HTR5A, and in screening for candidate drugs to treat diseases
 CC related to HTR5A activity, such as neurological disorders, including
 CC depression and epilepsy. Sequences ABK72339-ABK72358 represent allele-
 CC specific oligonucleotide probes used for detecting HTR5A gene
 CC polymorphisms

 CC Identifying binding molecules for ligands, particularly tumour antigens -
 CC by selectively immobilising a population of binding molecules to a solid
 CC support and screening for binding to two or more ligands.
 XX
 PS Example 5; Page 54; 80pp; English.
 XX
 CC This sequence is a primer for DNA encoding a light chain complementarity
 CC determining region (CDR) from a tumour antigen specific antibody. The
 CC invention relates to a method for identifying a binding molecule having
 CC selective affinity for a ligand comprising: (a) selectively immobilising
 CC a diverse population of binding molecules to a solid support; (b)
 CC simultaneously contacting the diverse population immobilised on the solid
 CC support with 2 or more ligands; and (c) determining at least one binding
 CC molecule which selectively binds to one or more of the ligands. The
 CC method allows for the rapid and efficient methods for the identification
 CC of binding molecules which exhibit selective affinity for one or more
 CC ligands of interest. They are used particularly for identifying tumour-
 CC specific binding polypeptides which can be used as targeting agents for
 CC cancer therapy that minimises impact on non-tumour tissues

XX Set of oligonucleotides, useful for diagnosis and cell typing, is
 PT designed to detect single-nucleotide polymorphisms and cytosine
 PT methylation status.

PS Claim 1; SEQ ID NO 184666; 29pp + Sequence Listing; German.

XX This invention describes novel oligonucleotide primers or peptide nucleic
 CC acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP)
 CC and cytosine methylation status in chemically pretreated genomic DNA. The
 CC oligonucleotides are used for diagnosis and/or prognosis of cancer and a
 CC range of diseases including immune system, gastrointestinal, respiratory,
 CC central nervous system, cardiovascular and metabolic disorders. The
 CC oligomers are also used for detecting cell type differentiation. ABC00010
 CC -ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073
 CC represent the oligomers described in the invention. NOTE: The sequence
 CC data for this patent did not form part of the printed specification, but
 CC was obtained in electronic format from WIPO at

XX      Enzymatic nucleic acid molecules having a hammer-head motif - used for
PT      the treatment of arthritis, induction of graft tolerance or treatment of
PT      auto-immune diseases.
XX
XX      Claim 10; Page 188; 307pp; English.
PS
XX
XX      The present invention describes a novel enzymatic nucleic acid (ENA)
CC      having a hammerhead motif (HM) comprising: (i) at least 5 ribose residues
CC      ; (ii) a 2'-C-allyl modification at position 4 of the ENA; (iii) at least
CC      ten 2'-O-methyl modifications; and (iv) a 3'-end modification. The ENA's
CC      can inhibit collagenase and stromelysin production in the synovial
CC      membrane of joints for the treatment or prevention of arthritis,
CC      particularly osteoarthritis or rheumatoid arthritis. The ENA's can also
CC      be used to treat antigen presenting cells of a donor to induce tolerance
CC      in a recipient to an alloantigen of a donor. They can also be used for
CC      enhancing graft tolerance or for treating autoimmune disease, and for
CC      treating allergies and other inflammatory conditions. The ENA's can also
CC      be used in diagnosis. Ribozyme therapy impacts on the expression of
CC      stromelysin without introducing the non-specific effects upon gene
CC      expression which accompany treatment with retinoids and dexamethasone.
CC      The concentration of ribozyme required to affect a therapeutic treatment
CC      is lower than that required of antisense molecules, and is highly
CC      specific. The present sequence is used in the exemplification of the
CC      present invention

 XX Sequencing nucleic acid by mass spectrometric analysis - for detecting
 PT nucleic acids, telomerase activity, oncogene mutations, or cancer-
 PT specific sequences, for diagnosis of disease.
 XX
 PS Claim 48; Page 249; 478pp; English.
 XX
 CC A process has been developed for determining the sequence of a target
 CC nucleic acid. The process comprises: (i) generating at least two
 CC fragments (F) from the target nucleic acid; and (ii) analysing F by mass
 CC spectrometry (MS). The sequences in AAV39483 to AAV39592 are specifically
 CC claimed primers for use in the mass spectrometric analysis of the above
 CC process. The process is used to detect genetic diseases (e.g.
 CC haemophilia, thalassemia, Duchenne muscular dystrophy, Alzheimer's
 CC disease, cystic fibrosis and many others) or chromosomal abnormalities
 CC (or predisposition); infections and cancers; also for establishing
 CC identity and heredity. Particular applications are diagnosis of
 CC neuroblastoma, detecting telomerase, determining family relationships and
 CC HLA compatibility, and in genetic fingerprinting. Compared with known
 CC methods using MS, this process requires fewer specific reagents and is
 CC better suited to automation. Extended primers are shorter; primer
 CC annealing is more efficient and the process allows detection of many
 CC sequences simultaneously

XX
XX Novel ribozymes for the treatment of diseases and conditions related to
PT hepatitis C infection.
XX
XX Claim 1; Page 69; 123pp; English.
XX
XX The present sequence represents the preferred target sequence of an
CC enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves
CC the Hepatitis C virus (HCV) RNA sequence at the base position given in
CC the descriptor line. The HCV sequence was screened for optimal ribozyme
CC target sites using a computer folding algorithm and regions of the mRNA
CC which did not form secondary folding structures and contained potential
CC ribozyme cleavage sites were identified. Ribozymes were synthesised to

CC target these sites and their activities optimised by either varying the
CC length of the binding arms or by modification to prevent degradation by
CC nucleases. The ribozymes of the invention inhibit gene expression and/or
CC viral replication, and are used to treat diseases associated with
CC Hepatitis C virus (HCV) infection, e.g. cirrhosis, liver failure and
CC hepatocellular carcinoma. The ribozymes may be used in combination with
CC interferon to treat HCV infection, other infectious diseases, autoimmune
CC diseases, and cancer

XX
XX Identifying target nucleic acid sequence in a biological sample useful
PT for diagnosis of genetic disease or chromosomal abnormality, involves
PT using mass spectrometer.
XX
XX Example 9; Col 47; 95pp; English.
XX
XX The present invention describes a method developed for identifying a
CC target nucleic acid sequence (NA) in a biological sample as normal or
CC mutant, by hybridising the NA with a mutant or normal primer capable of
CC hybridising to the mutated or wildtype sequence in the target NA and
CC identifying the target NA by mass spectrometry. The method can be used
CC for diagnosis of genetic disease, chromosomal abnormality, a
CC predisposition to a genetic disease, cancer or an infection, by
CC identifying a target nucleic acid sequence in a biological sample. The
CC method is also useful for diagnosing a predisposition to a disease or
CC condition (e.g. obesity, atherosclerosis) or to provide information
CC relating to identity, heredity or compatibility (e.g. HLA phenotyping).
CC The method is highly accurate, reliable and avoids electrophoretic,
CC labeling and detection steps. The entire method can be completed within 2
CC -3 hours and is less expensive. Nucleic acid fragments are identified
CC detected at the same time by the specific molecular weights and the
CC method allows rigorous controls for preventing false negative or positive
CC results. The present sequence represents a DNA sequence used in an

```

CC example from the present invention for solid state sequencing and mass
CC spectrometer detection

 DR Identifying mutation in nucleic acid sequence for diagnosing genetic
 PT disease, involves hybridizing target sequence with complementary probe
 PT and contacting the heteroduplex with single strand specific endonuclease.
 XX Example 9; Col 41; 91pp; English.
 CC The present invention relates to identifying the presence or absence of a
 CC mutation in a target nucleic acid sequence. The method involves
 CC hybridizing the target sequence with an oligonucleotide probe
 CC complementary to a region of the target sequence that can contain a
 CC mutation. The resulting heteroduplex is treated with a single strand
 CC specific endonuclease and mass spectrometry is used to detect the product.
 CC The method allows for rigorous controls to prevent false negative or
 CC positive results and avoids electrophoretic steps, labeling and
 CC subsequent detection of a label. The present sequence is a 15-mer
 CC template captured by a probe duplex

XX PT Detecting target nucleic acid sequence in sample, useful for diagnosing
XX PT genetic disease or chromosomal abnormality, comprises amplifying nucleic
XX PT acid containing target sequence and detecting amplified product by mass
XX PT spectrometry.
XX PS Example 9; Col 41; 92pp; English.
XX CC The invention relates to a method of detecting target nucleic acid
XX CC sequences (S) in a biological sample, comprising performing on nucleic
XX CC acid molecule(s) containing (S), a first polymerase chain reaction (PCR)
XX CC to produce a first amplification product (P1), performing on P1 a second
XX CC PCR to produce a second amplification product (P2), and detecting P2 by
XX CC mass spectrometry, thus detecting the presence of (S) in the biological
XX CC sample. The method is useful for detecting the presence of target nucleic
XX CC acid sequence(s) in a biological sample obtained from an individual, and
XX CC detecting (S) provides a DNA fingerprint or is indicative of a disease or
XX CC condition such as genetic disease, chromosomal abnormality, genetic
XX CC predisposition, viral infection, fungal infection, bacterial infection,
XX CC or postnatally a genetic disease or chromosomal abnormality, a
XX CC predisposition to a disease or condition (e.g., obesity, atherosclerosis,
XX CC cancer), or infection by a pathogenic organism (e.g. virus, bacteria,
XX CC parasitic or fungus), or to provide information relating to identity
XX CC heredity, or compatibility (e.g. human leukocyte antigen (HLA)
XX CC phenotyping). The method is fast, highly accurate and reliable. ABK98702-
XX CC ABK98839 represent primers and DNA sequences used in examples which
XX CC demonstrate the method of the invention

 XX
 CC The present invention relates to detecting a target nucleic acid
 CC sequence, useful for diagnosing a genetic disease, a chromosomal
 CC abnormality or an infection by a pathogen and for determining identity or
 CC heredity by employing mass spectrometry-based processes. The method
 CC involves hybridising a primer to a nucleic acid molecule comprising a
 CC target nucleic acid sequence, extending the primer using a polymerase to
 CC produce an extension product, selectively cleaving the 5' end of the
 CC primer from the extension product to produce a portion of the primer and
 CC a cleaved extension product and detecting the cleaved extension product
 CC by mass spectrometry. The present sequence is an oligonucleotide related
 CC to the invention

XX PT Novel polymorphic variants of zinc finger protein homologous to zfp-36 in
 PT mouse gene, useful in studying expression and function of the protein,
 PT useful for screening drugs to treat diseases e.g. rheumatoid arthritis.

XX PS Claim 16; Page 13; 60pp; English.

XX CC The present sequence is that of an oligonucleotide used for assaying a
 CC polymorphism in the zinc finger protein homologous to zfp-36 in mouse
 CC (ZFP36) gene of the invention. The specification describes a newly
 CC isolated polynucleotide comprising a sequence which is a polymorphic
 CC variant (PV) of a reference sequence for the ZFP36 gene (see ABA97001) or
 CC its fragment and its encoded protein. The ZFP36 polynucleotides and
 CC polypeptides have antirheumatic, immunosuppressive and antiarthritic
 CC activities. The ZFP36 polypeptide is useful for screening drugs targeting
 CC the ZFP36 polypeptide. ZFP36 isogenes or haplotype pairs are useful for
 CC improving the efficiency and reliability of the discovery and development
 CC of drugs for treating diseases associated with ZFP36 activity, e.g.,
 CC autoimmune diseases such as rheumatoid arthritis. Haplotyping the ZFP36
 CC gene in an individual gives useful information for validating ZFP36 as a
 CC candidate target for treating a specific condition predicted to be

CC associated with ZFP36 activity. Genotyping the ZFP36 gene of an
 CC individual can give information used for developing diagnostic tests and
 CC therapeutic treatments. The isolated polynucleotide is useful in studying
 CC the expression and function of ZFP36 and in drug screening. Antibodies
 CC specific for the ZFP36 protein are useful in many diagnostic and
 CC prognostic formats and therapeutic methods. A recombinant non-human
 CC organism transformed with the ZFP36 gene is useful in studying expression
 CC of the ZFP36 isogenes in vivo, for in vivo drug screening and testing.
 CC Allele-specific oligonucleotides (ASO) are useful as probes and primers
 CC and for assaying a polymorphism in the target region

DR Novel isolated human electron-transfer-flavoprotein, beta polynucleotide,
XX useful for therapeutic purposes, for studying the expression and function
XX of the polynucleotide, and for expressing the flavoprotein.
XX
PS Claim 17; Page 14; 143pp; English.
XX
CC The invention comprises DNA, cDNA and protein sequences of the human
CC electron-transfer flavoprotein, beta polypeptide (ETPF) gene (located on
CC chromosome 19q13.3-13.4). The invention specifically relates to the
CC identification of 27 novel polymorphic sites within the ETPF gene.
CC Electron-transfer flavoprotein (ETPF) is an obligatory electron acceptor
CC for nine primary flavoprotein dehydrogenases and is located in the
CC mitochondrial matrix. ETPF is composed of an alpha (ETPA) and a beta
CC (ETPB) subunit. Electrons accepted by ETPF are transferred to the
CC mitochondrial respiratory chain by ETPF dehydrogenases (ETPDHs).
CC Deficiency of ETPF or ETPDH leads to glutaric acidemia type II (GAI1).
CC Therefore ETPF is a pharmaceutically-important gene in the treatment of
CC GAI1. The novel ETPF polymorphisms identified in the invention are useful
CC for genotyping and haplotyping the ETPF gene of an individual. The ETPF
CC protein and nucleic acids of the invention are useful for studying the
CC expression and function of ETPF in vivo. The ETPF protein and nucleic
CC acids are also useful for testing the efficacy of therapeutic agents and
CC compounds for glutaric acidemia type II. The nucleic acids of the
CC invention are useful in the production of a transgenic animal expressing
CC the ETPF gene. Nucleic acids ABL39414-ABL39440 represent claimed ETPF
CC allele-specific probes. Nucleic acids ABL39441-ABL39494 represent claimed

PT Novel caspase 5 apoptosis-related cysteine protease, useful
XX therapeutically and in screening for drugs targeting protease
XX polypeptide.
XX
PS Claim 14; Page 14; 115pp; English.
XX
CC The invention relates to single nucleotide polymorphisms in the gene
CC encoding the human caspase 5, apoptosis-related cysteine protease (CASP5)
CC polypeptide. A method for haplotyping the CASP5 gene in an individual
CC comprises identifying the nucleotide at one or more polymorphic sites and
CC determining whether one of the copies of the gene is defined by one of
CC the CASP5 haplotypes given in the specification or whether both copies
CC are defined by a haplotype pair. This method is useful in genotyping,
CC whereby all possible haplotype pairs can be assigned to specific
CC genotypes. An association between a trait and a haplotype or haplotype
CC pair of the CASP5 gene can be identified by comparing the frequency of
CC the haplotype or haplotype pair in a population exhibiting the trait with
CC the frequency of the haplotype or haplotype pair in a reference
CC population, where a higher haplotype frequency in the trait population
CC indicates the trait is associated with the haplotype or haplotype pair.
CC CASP5 and its corresponding DNA are used for studying the expression and
CC function of CASP5, for use in screening for candidate drugs to treat
CC diseases related to CASP5 activity, such as cancer (e.g. hereditary
CC nonpolyposis colorectal cancer, gastrointestinal tumours and endometrial
CC tumours). Sequences ABK81480-ABK81519 represent allele-specific
CC oligonucleotide sequencing primers used to detect CASP5 gene

XX Novel genetic variants of solute carrier family 26, member 2 isogene
XX useful in studying expression and function of the protein, and for
XX screening drugs to treat diseases e.g. osteochondrodysplasias.
XX
XX Claim 17; Page 13; 72pp; English.
XX
XX The present invention relates to a new novel polynucleotide with a
XX sequence having a solute carrier family 26, member 2 (SLC26A2) isogene
XX selected from 4 isogenes, with regions of a sequence of 12212 bp as given
XX in specification. The new polynucleotide is also defined by a
XX corresponding set of polymorphisms whose locations and identities are
XX given in the specification. The molecules of the invention are useful for
XX improving the efficiency and reliability of several steps in the
XX discovery and development of drugs for treating diseases associated with
XX SLC26A2 activity e.g. osteochondrodysplasias. The methods of the
XX invention are useful for haplotyping and genotyping the SLC26A2 gene in
XX an individual. Allele-specific oligonucleotides (ASO) are useful as
XX probes and primers, and for assaying a polymorphism in the target region.
XX Without requiring any a prior knowledge of the phenotypic effect of any
XX particular SLC26A2 polymorphism, the methods of the invention provide the
XX scientist with a tool to identify lead compounds that are more likely to
XX show efficacy in clinical trials. The present nucleic acid sequence
XX represents one of a collection of ASO probes (ABK12921-ABK12932) that
XX were used in the invention to detect polymorphisms in the human SLC26A2
XX gene

XX Claim 17; Page 13; 60pp; English.
XX CC
XX The present invention relates to genetic variants of human neurotrophin
XX CC (NTF) 3 gene. The invention also relates to compositions and methods for
XX CC haplotyping and/or genotyping the NTF3 gene in an individual. Sequences
XX CC of the invention are useful for studying the expression and function of
XX CC NTF3 protein for use in screening for candidate drugs to treat diseases
XX CC related to NTF3 activity. The polymorphism and haplotype data is useful
XX CC for validating whether NTF3 is a suitable target for drugs to treat
XX CC nervous system disorders and congenital heart defects, screening for such
XX CC drugs and reducing bias in clinical trials of such drugs. They are also
XX CC useful for therapeutic purposes. The haplotyping method is useful for
XX CC improving the efficiency and outcome of several steps in the discovery
XX CC and development of drugs for treating diseases associated with NTF3
XX CC activity such as nervous system disorders and congenital heart defects.
XX CC It is also useful for validating NTF3 as a candidate target for treating
XX CC a specific condition or disease predicted to be associated with NTF3
XX CC activity. The method is also useful for screening compounds to treat a
XX CC specific condition or disease predicted to be associated with NTF3
XX CC activity. Sequences of the invention are also used in gene therapy. The
XX CC present DNA sequence is an allele-specific oligonucleotide (ASO) probe
XX CC used to detect human NTF3 gene polymorphisms

XX PS
XX Claim 1; Page 38; 80pp; English.
XX CC
XX The present invention relates to enzymatic nucleic acids which
XX CC specifically cleave RNA derived from Hepatitis C virus (HCV). The
XX CC enzymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin
XX CC (HP) motif where the binding arms comprise sequences complementary to one
XX CC of the substrate sequences defined in the specification. The HCV
XX CC ribozymes are useful for modulating the expression and/or replication of
XX CC HCV. They can be used to treat cirrhosis, liver failure and/or
XX CC hepatocellular carcinoma. The HCV ribozymes are also useful for treating
XX CC a condition associated with HCV infection in conjunction with one or more
XX CC other drug therapies, particularly type I interferon, especially
XX CC interferon alpha, beta or gamma or consensus interferon. The present
XX CC sequence represents a substrate for a HCV hammerhead (HH) ribozyme. Note:
XX CC some of the sequence data for this patent did not form part of the
XX CC printed specification. The complete sequence data for this patent was
XX CC obtained in electronic format directly from the USPTO web site at
XX CC seqdata.uspto.gov/psipsDIDEntry.html

XX PT useful in studying expression and function of the protein, and for
XX PT screening drugs to treat diseases e.g. Hodgkin's disease.
XX PS Claim 17; Page 14; 109pp; English.
XX CC The invention comprises the human lysosomal acid phosphatase 2 (ACP2)
XX CC nucleic acid and protein sequences. Specifically, the invention relates
XX CC to the discovery of 22 novel polymorphic sites within the ACP2 gene. The
XX CC invention also comprises methods for haplotyping and genotyping the ACP2
XX CC gene in an individual. The ACP2 gene (located on chromosome 11) encodes a
XX CC lysosomal-specific enzyme that catalyses the hydrolysis of
XX CC orthophosphoric monoesters to alcohol and phosphate. The ACP2 gene and
XX CC protein are pharmaceutically important in the treatment of Hodgkin's
XX CC disease (HD) and acid phosphatase deficiency. The novel ACP2 gene
XX CC polymorphisms of the invention are useful in haplotyping the ACP2 gene.
XX CC ACP2 haplotyping is useful in validating ACP2 as a target (and designing
XX CC drugs) for treating an ACP2-related disease or condition (e.g. Hodgkin's
XX CC disease and acid phosphatase deficiency). The ACP2 gene polymorphisms are
XX CC useful for ACP2 genotyping, which can also be used to develop diagnostic
XX CC tests and therapeutic treatments. The ACP2 protein and nucleic acids of
XX CC the invention are useful in the production of a transgenic animal which
XX CC expresses ACP2 protein. The ACP2 nucleic acids of the invention are
XX CC useful in the production of allele-specific oligonucleotides designed to
XX CC genotype each of the ACP2 polymorphisms. Nucleic acids ABL36299-ABL36320
XX CC represent claimed ACP2 allele-specific probes. Nucleic acids ABL36321-

XX DE New calmodulin-1 (CALM-1) isogene polymorphic variants, useful in
XX PT expressing CALM1 protein for use in screening for candidate drugs to
XX PT treat diseases related to CALM1 activity such as Alzheimer's disease.
XX PS Claim 15; Page 13; 82pp; English.
XX CC The invention relates to an isolated polynucleotide comprising a sequence
XX CC selected from a polymorphic variant of calmodulin 1 (CALM1). The
XX CC polymorphic variant comprises an CALM1 isogene defined by a haplotype
XX CC selected from haplotypes 1-21 given in the specification. The
XX CC polymorphisms are useful for studying the biological function of CALM1 as
XX CC well as in identifying drugs targeting this protein for the treatment of
XX CC a disorder related to its abnormal expression or function. The
XX CC polymorphic variants may also be used in screening for compounds
XX CC targeting CALM1 to treat a specific condition or disease predicted to be
XX CC associated with CALM1 activity. Establishing CALM1 haplotype or haplotype
XX CC pair of an individual is useful for improving the efficiency and
XX CC reliability of several steps in the discovery and development of drugs
XX CC for treating diseases associated with SCYA3 activity, e.g. Alzheimer's
XX CC disease and diseases involving defects in calcium-dependent signal
XX CC transduction. Haplotyping the CALM1 gene in an individual is also useful
XX CC in the design of clinical trials of candidate drugs for treating a
XX CC specific condition or disease predicted to be associated with CALM1
XX CC activity. AAS95892-AAS96018 represent human CALM1 allele-specific
XX CC oligonucleotides and PCR primers of the invention

XX Novel expression screening vector - used for preparing an antibody
 PT variable-region library comprising eukaryotic cells expressing membrane-
 PT bound polypeptide at the cell surface.
 PT
 XX Example 2; Page 15; 42pp; Japanese.
 PS
 XX Primers AAQ95497-8 were used to generate a fragment containing a
 CC multicloning site in the novel plasmid pSE. This plasmid is derived from
 CC pSC (a pUC18 based plasmid) which contains an antibody light chain (C-
 CC kappa) and heavy chain (C-gamma-1) constant region coding sequence, each
 CC under control of the SR-alpha promoter and linked to an appropriate
 CC signal peptide sequence. The light and heavy chain sequences have
 CC restriction sites created at the 5' ends of the coding sequences for the
 CC insertion of an antibody variable-region library created using the
 CC primers AAQ95503-39. The primers AAQ95497-8 were used to create an extra
 CC EcoRI site between the BamHI and ApaI site at the 5' of the heavy chain
 CC constant region coding sequence. The library is inserted in frame with
 CC each of the light and heavy chain constant region coding sequences. The
 CC heavy chain constant region is also linked to a transmembrane domain.
 CC Thus expression products from the vector will form an antibody which are
 CC membrane-bound. The vectors are used for the preparation of an antibody
 CC variable-region library. This allows efficient and accurate sorting of a
 CC variable base sequence of an antigen-differentiated antibody. Methods
 CC using these antibodies allow production of a human monoclonal antibody
 CC against an antigen

XX New antisense oligonucleotide analogs for inhibiting growth of cervical
XX tumors.
XX
XX Claim 4; Page 33; 40pp; English.
XX
XX This sequence represents an antisense oligonucleotide of the invention.
XX The antisense oligonucleotide analogs (ONs) have a sequence complementary
XX to a sequence of nucleotides 415-445 of human papilloma virus-16 (HPV-
XX 16). The antisense ONs can be used to inhibit expression of HPV gene
XX E6/E7 in living cells, preferably human keratinocytes or human cervical
XX cells. They bind to E6/E7 mRNA in the cell, prevent mRNA translation and
XX promote mRNA degradation by intracellular RNase H. They can be used for
XX preventing transformation of living cells by HPV. The antisense ONs are
XX used particularly for inhibiting the growth of cervical tumours

XX
PS Disclosure; Col 15-16; 168pp; English.
XX
CC The present sequence represents a polynucleotide that is able to form a
CC triple helix with a double stranded sequence. Cytosine bases in the
CC present can be replaced with 5-methylcytosine for increased triplex
CC stability. The present sequence is used in the assay of the invention,
CC where it can be part of the anchor DNA or reporter DNA sequence. The
CC assay comprises adding a sample containing double-stranded DNA test
CC sequences to an aqueous medium containing at least one complex of anchor
CC DNA, attached to a solid support, and reporter DNA, where either a part
CC of the anchor DNA or reporter DNA is designed to form a triple-strand
CC structure with part of the test sequence. Triplex formation results in
CC displacement of the reporter DNA which is detected as an indication of
CC the presence of the DNA test sequence. The method is used to detect DNA
CC sequences, particularly for identification of bacteria (by detecting
CC genes for ribosomal RNA) in clinical samples, but also detection of
CC oncogenes and Hepatitis B virus

```

PT useful e.g. for treatment of tumors and viral infection, also related
 PT polypeptide and antibodies.

PS Disclosure; Page 342; 771pp; French.

XX The invention relates to the isolation of 6327 nucleotide sequences,
 CC fragments of at least 15 consecutive nucleotides of these nucleotides, a
 CC sequence having at least 80% identity, after optimal alignment, with the
 CC nucleotides, a sequence that hybridizes under stringent conditions with
 CC the nucleotides, or the complement, or corresponding RNA, of the
 CC nucleotides. The nucleotides are used as probes or primers for detecting,
 CC identifying, quantifying and/or amplifying nucleic acids, as in vitro
 CC sense and antisense sequences, of nucleotides involved in tumour
 CC suppression or reversion, apoptosis and/or viral resistance, to produce
 CC recombinant polypeptides, and to prepare transgenic animals, as
 CC experimental models. The nucleotides (also vectors containing them and
 CC cells containing the vectors), the encoded polypeptides and antibodies
 CC (Ab) against the polypeptide are useful for prevention and/or treatment
 CC of viral infections or diseases characterized by development of tumours
 CC or cell degeneration (e.g. Alzheimer's disease or schizophrenia).
 CC Analysis of the expression of the nucleotides can be used for diagnosis
 CC and/or prognosis of these diseases. The nucleotides and polypeptides can
 CC also be used to screen for their specific interactive molecules,
 CC potentially useful for treating diseases associated with abnormal
 CC expression of the nucleotides.

PT Novel ribozymes for modulating the synthesis, expression and/or stability
 PT of an mRNA encoding an angiogenic factors.

XX Claim 56; Page 96; 305pp; English.

XX The present invention describes enzymatic cleave RNA molecules with RNA
 CC cleaving activity, which specifically cleave RNA encoded by an aryl
 CC hydrocarbon nuclear transporter (ARNT) gene, an integrin subunit beta 3
 CC gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAAI6775 to
 CC AAAI7167 and AAAI7561 to AAAI7622 represent ribozyme sequences for ARNT,
 CC and AAAI7168 to AAAI7560 and AAAI7623 to AAAI7684 represent their
 CC corresponding target sequences; AAAI7685 to AAAI8385 and AAAI9087 to
 CC AAAI9154 represent ribozyme sequences for Tie-2, and AAAI8386 to AAAI9086
 CC and AAAI9155 to AAAI9222 represent their corresponding target sequences;
 CC AAAI9223 to AAA20361 and AAA21501 to AAA21595 represent ribozyme
 CC sequences for integrin alpha 6 subunit, and AAA20362 to AAA21500 and
 CC AAA21596 to AAA21688 represent their corresponding target sequences;
 CC AAA21689 to AAA22475 and AAA23263 to AAA23342 represent ribozyme sequences
 CC for integrin subunit beta 3, and AAA22476 to AAA23262, AAA23343 to
 CC AAA23422 represent their corresponding target sequences. The ribozymes of
 CC the invention are used for modulating the synthesis, expression and/or
 CC stability of an mRNA encoding angiogenic factor, especially ARNT,
 CC integrin subunit beta-3, integrin subunit alpha-6, or Tie-2. They are
 CC especially used to treat cancer, diabetic retinopathy, age related
 CC macular degeneration (ARMD), inflammation, and arthritis, as well as
 CC neovascular glaucoma, myopic degeneration, psoriasis, verruca vulgaris,
 CC angiofibroma of tuberous sclerosis, pot-wine stains, Sturge Weber
 CC syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-Rendu syndrome,
 CC and other syndromes and diseases related to the levels of ARNT, Tie-2,
 CC integrin subunit alpha-6, or integrin subunit beta-3

PT Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA
PT stability - useful for treating e.g. tumour angiogenesis, psoriasis,
PT rheumatoid arthritis, etc., in a human patient.
XX
XX Claim 4; Page 170; 218pp; English.
XX
XX The present invention describes nucleic acid molecules which modulate the
CC synthesis, expression and/or stability of a mRNA encoding 1 or more
CC receptors of vascular endothelial growth factor (VEGF). A patient
CC (preferably human) having a condition associated with the level of the
CC fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing
CC receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour
CC angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be
CC treated by administering the nucleic acid molecule or the expression
CC vector to the patient. AAX67275 to AAX75752 represent specific examples
CC of nucleic acid molecules from the present invention

XX Identifying new catalytic nucleic acid that modulates selected processes
XX - especially ribozymes that cleave Raf RNA for treating cancer,
XX restenosis, and also new ribozymes and modified nucleoside triphosphates
XX used as antiviral agents and synthons.
XX
XX Claim 177; Page 152; 259pp; English.
XX
XX A method has been developed for the identification of a nucleic acid
XX capable of modulating a process in a biological system. The method
XX comprises: (a) introducing into the system a random library of nucleic
XX acid catalysts (NAC) having a substrate binding domain (SBD), comprising
XX a random sequence, and a catalytic domain (CD); and (b) identifying NAC
XX in systems where modulation has occurred and/or determining the sequence
XX of at least part of the SBDs in such systems. Nucleic acid molecules with
XX endonuclease activity and catalytic activity, from the present invention,
XX are used to modulate gene expression in plant and mammalian cells and to
XX cleave target nucleic acid, particularly for treating systemic diseases
XX caused by specific RNA, e.g. cancer, inflammation, psoriasis, non-hepatic
XX ascites and infection. They may also be used to detect genetic drift and
XX mutations in diseased cells and to determine c-rat RNA. Specifically NACs
XX with RNA-cleaving activity that modulate expression of the Raf gene, are
XX used to treat cancer, restenosis, psoriasis or rheumatoid arthritis, or
XX generally any condition associated with the level of c-rat. Introduction
XX of sugar/phosphate modifications increases stability against nuclease and
XX activity. AAV90922 to AAV93877 represent NACs that can be used in the
XX method, specifically for modulating the expression of a Raf gene

 DR System for transporting nucleic acid into cells, useful e.g. in gene
 PT therapy and for generating transgenic animals, comprises binding agent
 PT linked to nucleic acid, surface ligand and lytic agent.
 XX Disclosure; Fig 15a; 108pp; English.
 PS The present invention relates to a transporter system for delivering
 XX nucleic acid to a cell. The system comprises a nucleic acid binding
 CC complex, consisting of a binding molecule bonded non-covalently to the
 CC nucleic acid, and covalently to a surface ligand, and a lytic agent. The
 CC binding molecule is spermine or a spermidine derivative. Nucleotide
 CC sequences AAA36633-A36652 and peptide sequences AAY9456-Y98500 are used
 CC in the construction of the transporter system of the invention. The
 CC transporter system is used in gene therapy, particularly to deliver
 CC nucleic acids to hepatocytes, muscle cells or bone forming cells, e.g. for
 CC treating cardiovascular disease, cancer, and infection. The transporter
 CC systems are also used to create transgenic animals (as models for human
 CC carcinogenesis or disease or for drug testing). Other uses include
 CC transforming cells to produce proteins, or transfecting cells in vitro
 CC to study the function of the nucleic acid. The use of a surface ligand
 CC allows specific targeting of selected cells and tissues. The lytic agent
 CC provides for release of the nucleic acid into the cellular interior, from
 CC endosomes, without requiring endosomal or lysosomal degradation

 DR Nucleic acid transport system, useful for creating transgenic animals for
 PT assessing human disease such as cancer in an animal model.
 XX Disclosure; Fig 15A; 107pp; English.
 PS The invention relates to a nucleic acid transport system (NTS) for
 CC delivering nucleic acid into a cell. The NTS contains but is not limited
 CC to 5 components: (a) the nucleic acid or a macromolecule to be delivered;
 CC (b) a moiety that recognizes and binds to a cell surface receptor or
 CC antigen or is capable of entering a cell through cytosol; (c) a nucleic
 CC acid or macromolecular molecule binding moiety; (d) a moiety that is
 CC capable of moving or initiating movement through a nuclear membrane; and/
 CC or (e) a lysis moiety that enables the transport of the entire complex
 CC from the cell surface directly into the cytoplasm of the cell. The NTS
 CC delivers nucleic acid into the cellular interior as well as the nucleus
 CC of specific cells. The NTS can be used to treat disorders by targeting
 CC specific nucleic acid accordingly. The NTS can also be used to create
 CC transgenic animals for assessing human disease, such as cancer, in an
 CC animal model. The NTS can be used in vitro with tissue culture cells
 CC which allows the role of various nucleic acids to be studied by targeting
 CC specific expression into specifically targeted tissue culture cells. The
 CC lysis agent within the NTS avoids the problem of endosomal/lysosomal
 CC degradation

 DR New nucleic acids that interact, and optionally cleave, target sequences,
 XX used to treat cancer.
 PT Claim 77; Page 74; 148pp; English.
 PS The present invention describes nucleic acids (A) that interact stably
 CC with a target sequence and contain at least one phosphorodithioate
 CC link, having endonuclease activity. (A), and more generally any catalytic
 CC nucleic acid (A') that modulates expression of the oestrogen receptor
 CC gene, are used to treat cancer (particularly of breast or endometrium),
 CC in vivo or by transforming cells ex vivo and implanting treated cells, or
 CC for other conditions associated with levels of oestrogen receptor.
 CC Because of the high selectivity for targeted RNA, (A) can also be used to
 CC correlate inhibition of gene expression with alterations in phenotype,
 CC particularly for identification of therapeutic targets, and as research
 CC reagents (for RNA, in the same way that restriction endonucleases are
 CC used with DNA). The combination of modifications in (A) improves
 CC resistance to nucleases, binding affinity and/or activity. AAA23503 to
 CC AAA24747 represent oestrogen receptor hammerhead ribozyme sequences, and
 CC AAA24748 to AAA25992 represent their corresponding target sequences.
 CC AAA25993 to AAA26105 represent oestrogen receptor hairpin ribozyme
 CC sequences, and AAA26107 to AAA26218 represent their corresponding target
 CC sequences. AAA26219 to AAA26271 represent other ribozyme sequences and
 CC antisense oligonucleotides used in the exemplification of the present
 CC invention

 XX Nucleic acid transporter system for delivering nucleic acid into a cell,
 PT useful for delivering proteins and polypeptides to cells, including
 PT growth factors, enzymes, hormones, and tumor suppressors.
 XX
 XX Disclosure; Col 93-94; 105pp; English.
 PS
 XX
 XX This invention describes a novel system (I) for delivering a nucleic acid
 CC to a cell, comprising a binding complex comprising a ligand binding
 CC molecule noncovalently bound to a nucleic acid and covalently linked to a
 CC surface ligand, and a second binding complex comprising a second binding
 CC molecule noncovalently bound to a nucleic acid and covalently linked to a
 CC nuclear ligand. The complexes are simultaneously bound to the nucleic
 CC acid. The nucleic acid transporter system can also be used in a method
 CC for the in vivo targeting of the insertion of DNA into a cell. It can
 CC also be used in processes for producing transformed cell lines. The
 CC system can be used to deliver a variety of proteins and polypeptides,
 CC such as hormones, growth factors, enzymes, clotting factors,
 CC apolipoproteins, receptors, drugs, oncogenes, tumor antigens, tumor
 CC suppressors, viral antigens, parasitic antigens, and bacterial antigens.
 CC The transporter system uses lysis agents to overcome the problems of
 CC endosomal/lysosomal degradation seen with prior art systems

XX Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense

PT constructs, which down regulate expression of a CD20 gene or neurite

PT growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and

PT central nervous system injury.

XX Claim 88; Page 83; 200pp; English.

XX The invention relates to a nucleic acid molecule which down regulates

CC expression of a CD20 gene and a nucleic acid molecule which down

CC regulates expression of a neurite growth inhibitor gene (NOGO). The

CC nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a

CC DNzyme) an inozyme (an endolytic nucleic acid cleaving an RNA molecule

CC possessing an NCH motif), a G-cleaver (cleaving RNA with a NYN motif) or

CC an amberzyme (cleaving RNA with an NGN triplet), a zinzyme (cleaving RNA

CC with a YGY motif). The CD20-targeting nucleic acid is used to cleave RNA

CC of CD20 in the presence of a divalent cation that is preferably Mg²⁺.

CC Furthermore, it may be contacted with a cell to reduce CD20 activity of

CC the cell and treat a patient having a condition associated with the level

CC of CD20. The treatment may further comprise the use of one or more

CC therapies. In particular, the CD20 targeting nucleic acid may be used to

CC treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-

CC Hodgkin's lymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic

CC leukaemia, HIV (human immunodeficiency virus) associated NHL, mantle-cell

CC lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma,

CC immune thrombocytopaenia, and inflammatory arthropathy. The NOGO-

CC targeting nucleic acid is used to cleave RNA of the NOGO gene in the

CC presence of a divalent cation that is preferably Mg²⁺. Furthermore, the

CC nucleic acid may be contacted with a cell to reduce NOGO activity of the

CC cell and treat a patient having a condition associated with the level of

CC NOGO. The treatment may further comprise the use of one or more

CC therapies. In particular, the NOGO-targeting nucleic acid may be used to

CC treat central nervous system (CNS) injury and cerebrovascular accident

CC (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS),

CC chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS),

CC Parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob

CC disease, muscular dystrophy, and/or other neurodegenerative disease

CC states which respond to the modulation of NOGO expression. The present

CC sequence is an inozyme of the invention

PT Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense

PT constructs, which down regulate expression of a CD20 gene or neurite PT growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and

PT central nervous system injury.

Claim 88; Page 114; 200pp; English.

The invention relates to a nucleic acid molecule which down regulates expression of a Cn20 gene and a nucleic acid molecule which down

expression of the CD20 gene. The CD20 gene encodes a protein that regulates expression of a neurite growth inhibitor gene (NOMO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a DNzyme) an inzyme (an endolytic nucleic acid cleaving an RNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with a NYN motif) or an amzyme (cleaving RNA with an NGN triplet), a zynzyme (cleaving RNA with a vxy motif). The CD20-targeting nucleic acid is preferably Mg²⁺. In CD20 in the presence of a divalent cation that is preferably Mg²⁺. Furthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more

therapies. In particular, the CD20 targeting nucleic acid may be used to treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-Hodgkin's lymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic leukaemia, HIV (human immunodeficiency virus) associated NHL, mantle-cell lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, immune thrombocytopaenia, and inflammatory arthropathy. The NOGO-targeting nucleic acid is used to cleave RNA of the NOGO gene in the presence of a divalent cation that is preferably Mg^{2+} . Furthermore, the nucleic acid may be contacted with a cell to reduce NOGO activity of the cell and treat a patient having a condition associated with the level of NOGO. The treatment may further comprise the use of one or more therapies. In particular, the NOGO-targeting nucleic acid may be used to treat central nervous system (CNS) injury and cerebrovascular accident (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS), chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS), Parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob disease, muscular dystrophy, and/or other neurodegenerative disease states which respond to the modulation of NOGO expression. The present sequence is a DNAzyme molecule of the invention

PT Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense
 PT constructs, which down regulate expression of a CD20 gene or neurite
 PT growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and
 PT central nervous system injury.

XX Claim 88; Page 135; 200pp; English.

XX The invention relates to a nucleic acid molecule which down regulates
 CC expression of a CD20 gene and a nucleic acid molecule which down
 CC regulates expression of a neurite growth inhibitor gene (NOMO). The
 CC nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a
 CC DNzyme) an inozyme (an endolytic nucleic acid cleaving an RNA molecule
 CC possessing an NCH motif), a G-cleaver (cleaving RNA with a NYN motif) or
 CC an amberyne (cleaving RNA with an NGN triplet), a zinzyme (cleaving RNA
 CC with a YGY motif). The CD20-targeting nucleic acid is used to cleave RNA
 CC of CD20 in the presence of a divalent cation that is preferably Mg²⁺.
 CC Furthermore, it may be contacted with a cell to reduce CD20 activity of
 CC the cell and treat a patient having a condition associated with the level
 CC of CD20. The treatment may further comprise the use of one or more
 CC therapies. In particular, the CD20 targeting nucleic acid may be used to
 CC treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-
 CC Hodgkin's lymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic
 CC leukaemia, HIV (human immunodeficiency virus) associated NHL, mantle-cell
 CC lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma,
 CC immune thrombocytopaenia, and inflammatory arthropathy. The NOMO-
 CC targeting nucleic acid is used to cleave RNA of the NOMO gene in the
 CC presence of a divalent cation that is preferably Mg²⁺. Furthermore, the
 CC nucleic acid may be contacted with a cell to reduce NOMO activity of the
 CC cell and treat a patient having a condition associated with the level of
 CC NOMO. The treatment may further comprise the use of one or more
 CC therapies. In particular, the NOMO-targeting nucleic acid may be used to
 CC treat central nervous system (CNS) injury and cerebrovascular accident
 CC (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS),
 CC chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS),
 CC Parkinson's disease, ataxia, Huntington's disease, Creutzfeldt-Jakob
 CC disease, muscular dystrophy, and/or other neurodegenerative disease
 CC states which respond to the modulation of NOMO expression. The present
 CC sequence is an amberyne molecule of the invention

XX Oligonucleotide for targeted alterations of genetic sequences and for
PT treating cystic fibrosis, comprises at least one mismatch and chemical
PT modification.
XX
XX Claim 7; Page 240; 294pp; English.
XX
XX The present invention provides single-stranded oligonucleotides which can
CC be used for the targeted alteration of genomic sequences, where the
CC oligonucleotide has at least one mismatch compared with the genomic
CC sequence to be altered. In particular, these sequences are directed at
CC the following genes: adenosine deaminase, p53, beta-globin,
CC retinoblastoma, BRCA1, BRCA2, CFTR, cyclin-dependent kinase inhibitor 2A
CC (CDKN2A), APC, Factor V, Factor VIII, Factor IX, haemoglobin alpha locus
CC 1 (HBA1), haemoglobin alpha locus 2 (HBA2), MLH1, MSH2, MSH6,
CC apolipoprotein E (APOE), LDL receptor (LDLR), UDP-glucuronosyltransferase
CC (UGT1), amyloid precursor protein (APC), presenilin-1 (PSEN1) and
CC presenilin-2 (PSEN2). These can be used in the gene therapy of diseases
CC such as cancer, adenosine deaminase deficiency, cystic fibrosis,
CC haemophilia, hypercholesterolaemia, thalassaemia, sickle cell anaemia,
CC Alzheimer's disease, melanoma, adenomatous polyposis of the colon and
CC various syndromes. The present sequence is one of the gene correcting
CC oligonucleotides of the invention

XX Oligonucleotide for targeted alterations of genetic sequences and for
PT treating cystic fibrosis, comprises at least one mismatch and chemical
PT modification.
XX
XX Claim 7; Page 262; 294pp; English.
XX
XX The present invention provides single-stranded oligonucleotides which can
CC be used for the targeted alteration of genomic sequences, where the
CC oligonucleotide has at least one mismatch compared with the genomic
CC sequence to be altered. In particular, these sequences are directed at
CC the following genes: adenosine deaminase, p53, beta-globin,
CC retinoblastoma, BRCA1, BRCA2, CFTR, cyclin-dependent kinase inhibitor 2A
CC (CDKN2A), APC, Factor V, Factor VIII, Factor IX, haemoglobin alpha locus
CC 1 (HBA1), haemoglobin alpha locus 2 (HBA2), MLH1, MSH2, MSH6,
CC apolipoprotein E (APOE), LDL receptor (LDLR), UDP-glucuronosyltransferase
CC (UGT1), amyloid precursor protein (APC), presenilin-1 (PSEN1) and
CC presenilin-2 (PSEN2). These can be used in the gene therapy of diseases
CC such as cancer, adenosine deaminase deficiency, cystic fibrosis,
CC haemophilia, hypercholesterolaemia, thalassaemia, sickle cell anaemia,
CC Alzheimer's disease, melanoma, adenomatous polyposis of the colon and
CC various syndromes. The present sequence is one of the gene correcting
CC oligonucleotides of the invention

 XX
 XX Novel nucleic acid for the treatment of papilloma or hepatitis virus
 PT induced conditions comprises a catalytic region which produces a
 PT cytotoxic or cytostatic effect in the infected cell.
 XX
 XX Claim 1; Page 101; 143pp; English.
 XX
 XX The invention relates to the discovery, identification and

CC Characterisation of toxic agents lethal to pathogens and methods for
 CC targeting such toxic agents to a pathogen or pathogen infected cells in
 CC order to treat and/or eradicate the infection. In particular the
 CC invention relates to at least one nucleic acid molecule, which
 CC specifically hybridises to mRNA encoding at least one vital protein
 CC associated with the transformation or plasmid copy number control, which
 CC hybridises to a viral polyadenylation signal or a core, pre core or
 CC polymerase encoding sequence. Specifically, the invention relates to the
 CC delivery of one or more toxic gene products, antisense RNAs, ribozymes,
 CC DNazymes or a combination thereof. The nucleic acids have antiviral
 CC activity and can be used in gene therapy. They are useful for the
 CC treatment of papilloma or hepatitis virus induced conditions and can
 CC produce a cytotoxic or cytostatic effect in papillomavirus or hepatitis B
 CC infected cells. The papilloma virus induced condition is selected from
 CC warts, cervical dysplasia, cervical carcinoma, carcinoma in situ and
 CC laryngeal papilloma. ABA02588-ABA02610 comprise ribozyme flanking
 CC sequences and ABA02612-ABA02660 comprise DNazyme target sequences, useful
 CC to the invention

XX assessing human disease such as cancer in an animal model.
 PS Disclosure; Fig 15; 11pp; English.
 XX The sequence represents the pyrimidine-rich oligonucleotide #2 used in a
 CC nucleic acid transporter system. The nucleic acid transporter system uses
 CC nucleic acid binding complexes containing surface ligands which are
 CC capable of binding to a cell surface receptor and entering the cell
 CC through cytosol. The compounds of the invention are either ligands,
 CC binding molecules (surface ligands), lysis agents, spacer molecules or
 CC their intermediates. The ligands, binding molecules, lysis agents and
 CC spacer molecules are used in nucleic acid transporter systems to deliver
 CC nucleic acid into specific cells e.g. in gene therapy to deliver nucleic
 CC acid into hepatocytes, muscle cells or bone forming cells

 XX New polypeptide, for raising antibodies that recognize hGDMPLP-1 proteins,
 PT or as specific biomolecule capture probes for surface-enhanced laser
 PT desorption/ionization, comprises human myosin-like protein hGDMPLP-1.

XX Disclosure; SEQ ID NO 6052; 214pp; English.
 XX The present invention describes a human genome-derived myosin-like
 CC protein 1 (hGDMPLP-1). The protein and polynucleotide sequences of hGDMPLP-
 CC 1 can be used in gene therapy and vaccine production. The hGDMPLP-1
 CC nucleic acids can be used as probes to detect, characterise and quantify
 CC hGDMPLP-1 nucleic acids in samples, as amplification substrates, to
 CC provide initial substrates for the recombinant engineering of hGDMPLP-1
 CC protein variants having desired phenotypic improvements, and for
 CC expressing the proteins. The hGDMPLP-1 proteins or polypeptides may be
 CC used as immunogens to raise antibodies that specifically recognise hGDMPLP
 CC -1 proteins, as standards in assays used to determine the concentration
 CC and/or amount specifically of hGDMPLP proteins, as specific biomolecule
 CC capture probes for surface-enhanced laser desorption/ionisation, as
 CC therapeutic supplement in patients having specific deficiency in hGDMPLP-1
 CC production, and in vaccines or for replacement therapy. The
 CC polynucleotide sequences encoding hGDMPLP-1 may be used for diagnosing a
 CC disorder associated with the expression of hGDMPLP-1, in particular heart
 CC and skeletal muscle disorders. hGDMPLP-1 is localised to chromosome 22.
 CC The present sequence represents an oligomer used in the screening of the
 CC hGDMPLP-1 sequence in the exemplification of the present invention. N.B.
 CC The sequence data for this patent did not form part of the printed
 CC specification, but was obtained in electronic format directly from WIPO

XX New polypeptide, for raising antibodies that recognize hGDMPLP-1 proteins,
PT or as specific biomolecule capture probes for surface-enhanced laser
PT desorption ionization, comprises human myosin-like protein hGDMPLP-1.
XX
XX Disclosure; SEQ ID NO 6053; 214pp; English.
XX
XX The present invention describes a human genome-derived myosin-like
CC protein 1 (hGDMPLP-1). The protein and polynucleotide sequences of hGDMPLP-
CC 1 can be used in gene therapy and vaccine production. The hGDMPLP-1
CC nucleic acids can be used as probes to detect, characterise and quantify
CC hGDMPLP-1 nucleic acids in samples, as amplification substrates, to
CC provide initial substrates for the recombinant engineering of hGDMPLP-1
CC protein variants having desired phenotypic improvements, and for
CC expressing the proteins. The hGDMPLP-1 proteins or polypeptides may be
CC used as immunogens to raise antibodies that specifically recognise hGDMPLP
CC -1 proteins, as standards in assays used to determine the concentration
CC and/or amount specifically of hGDMPLP proteins, as specific biomolecule
CC capture probes for surface-enhanced laser desorption/ionisation, as
CC therapeutic supplement in patients having specific deficiency in hGDMPLP-1
CC production, and in vaccines or for replacement therapy. The
CC polynucleotide sequences encoding hGDMPLP-1 may be used for diagnosing a
CC disorder associated with the expression of hGDMPLP-1, in particular heart
CC and skeletal muscle disorders. hGDMPLP-1 is localised to chromosome 22.
CC The present sequence represents an oligomer used in the screening of the
CC hGDMPLP-1 sequence in the exemplification of the present invention. N.B.
CC The sequence data for this patent did not form part of the printed
CC specification, but was obtained in electronic format directly from WIPO

XX
XX New polypeptide, for raising antibodies that recognize hGDMPLP-1 proteins,
XX or as specific biomolecule capture probes for surface-enhanced laser
XX desorption ionization, comprises human myosin-like protein hGDMPLP-1.
XX
XX Disclosure; SEQ ID NO 9913; 214pp; English.
XX
XX The present invention describes a human genome-derived myosin-like
XX protein 1 (hGDMPLP-1). The protein and polynucleotide sequences of hGDMPLP-
XX 1 can be used in gene therapy and vaccine production. The hGDMPLP-1
XX nucleic acids can be used as probes to detect, characterise and quantify
XX hGDMPLP-1 nucleic acids in samples, as amplification substrates, to
XX provide initial substrates for the recombinant engineering of hGDMPLP-1
XX protein variants having desired phenotypic improvements, and for
XX expressing the proteins. The hGDMPLP-1 proteins or polypeptides may be
XX used as immunogens to raise antibodies that specifically recognise hGDMPLP
XX -1 proteins, as standards in assays used to determine the concentration
XX and/or amount specifically of hGDMPLP proteins, as specific biomolecule
XX capture probes for surface-enhanced laser desorption ionisation, as
XX therapeutic supplement in patients having specific deficiency in hGDMPLP-1
XX production, and in vaccines or for replacement therapy. The
XX polynucleotide sequences encoding hGDMPLP-1 may be used for diagnosing a
XX disorder associated with the expression of hGDMPLP-1, in particular heart
XX and skeletal muscle disorders. hGDMPLP-1 is localised to chromosome 22.
XX The present sequence represents an oligomer used in the screening of the
XX hGDMPLP-1 sequence in the exemplification of the present invention. N.B.
XX The sequence data for this patent did not form part of the printed
XX specification, but was obtained in electronic format directly from WIPO

 XX
 CC The present invention describes a human genome-derived myosin-like
 CC protein 1 (hGDMPLP-1). The protein and polynucleotide sequences of hGDMPLP-
 CC 1 can be used in gene therapy and vaccine production. The hGDMPLP-1
 CC nucleic acids can be used as probes to detect, characterise and quantify
 CC hGDMPLP-1 nucleic acids in samples, as amplification substrates, to
 CC provide initial substrates for the recombinant engineering of hGDMPLP-1
 CC protein variants having desired phenotypic improvements, and for
 CC expressing the proteins. The hGDMPLP-1 proteins or polypeptides may be
 CC used as immunogens to raise antibodies that specifically recognise hGDMPLP
 CC -1 proteins, as standards in assays used to determine the concentration
 CC and/or amount specifically of hGDMPLP proteins, as specific biomolecule
 CC capture probes for surface-enhanced laser desorption/ionisation, as
 CC therapeutic supplement in patients having specific deficiency in hGDMPLP-1
 CC production, and in vaccines or for replacement therapy. The
 CC polynucleotide sequences encoding hGDMPLP-1 may be used for diagnosing a
 CC disorder associated with the expression of hGDMPLP-1, in particular heart
 CC and skeletal muscle disorders. hGDMPLP-1 is localised to chromosome 22.
 CC The present sequence represents an oligomer used in the screening of the
 CC hGDMPLP-1 sequence in the exemplification of the present invention. N.B.
 CC The sequence data for this patent did not form part of the printed
 CC specification, but was obtained in electronic format directly from WIPO
 CC at ftp.wipo.int/pub/published_pct_sequence

Novel polynucleotide which down regulates expression of Ets-related gene,
useful for treating cancer, diabetic retinopathy, macular degeneration,
arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome.

Claim 4; Page 105; 149pp; English.

The invention relates to a nucleic acid molecule (I) which down regulates
expression of an Ets-related gene (ERG). (I) is useful for treating
conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma,
tumour angiogenesis, diabetic retinopathy, macular degeneration, verruca
neovascular glaucoma, myopic degeneration, arthritis, psoriasis, verruca
vulgaris, angiofibroma of tuberous sclerosis, port-wine stains, Sturge
Weber syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-rendu
syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for
treating a patient having a condition associated with the level of ERG,
by contacting cells of the patient with (I) under conditions suitable for
the treatment. The method comprises the use of one or more therapies
under conditions suitable for the treatment. Leukaemia or tumour
angiogenesis is treated by administering (I) to the patient in
conjunction with one or more of other therapies such as radiation or
chemotherapy treatment. (I) is useful for reducing ERG activity in a
cell, by contacting the cell with (I). (I) is useful for cleaving RNA of
ERG gene, by contacting (I) with RNA, in the presence of a divalent
cation such as Mg2+. (I) is useful for diagnosis of conditions and
diseases related to the expression of ERG, and as diagnostic tool to
examine genetic drift and mutations within diseased cells or to detect
the presence of ERG RNA in a cell. (I) is useful for specifically
targeting genes that share homology with ERG gene or ERG fusion genes.
ABK17354-ABK22719 represent nucleic acids, including antisense and
enzymatic nucleic acid molecules which regulate expression of ERG, and
related PCR primers of the invention

 DR Novel polynucleotide which down regulates expression of Ets-related gene,
 XX useful for treating cancer, diabetic retinopathy, macular degeneration,
 PT arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome.
 XX Claim 4; Page 74; 149pp; English.
 XX The invention relates to a nucleic acid molecule (I) which down regulates
 CC expression of an Ets-related gene (ERG). (I) is useful for treating
 CC conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma,
 CC tumour angiogenesis, diabetic retinopathy, macular degeneration,
 CC neovascular glaucoma, myopic degeneration, arthritis, psoriasis, verruca
 CC vulgaris, angiofibroma of tuberous sclerosis, port-wine stains, Sturge
 CC Weber syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-rendu
 CC syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for
 CC treating a patient having a condition associated with the level of ERG,
 CC by contacting cells of the patient with (I) under conditions suitable for
 CC the treatment. The method comprises the use of one or more therapies
 CC under conditions suitable for the treatment. Leukaemia or tumour
 CC angiogenesis is treated by administering (I) to the patient in
 CC conjunction with one or more of other therapies such as radiation or
 CC chemotherapy treatment. (I) is useful for reducing ERG activity in a
 CC cell, by contacting the cell with (I). (I) is useful for cleaving RNA of
 CC ERG gene, by contacting (I) with RNA, in the presence of a divalent
 CC cation such as Mg²⁺. (I) is useful for diagnosis of conditions and
 CC diseases related to the expression of ERG, and as diagnostic tool to
 CC examine genetic drift and mutations within diseased cells or to detect
 CC the presence of ERG RNA in a cell. (I) is useful for specifically
 CC targeting genes that share homology with ERG gene or ERG fusion genes.
 CC ABK17354-ABK2719 represent nucleic acids, including antisense and
 CC enzymatic nucleic acid molecules which regulate expression of ERG, and
 CC related PCR primers of the invention

XX	DR	New Schizosaccharomyces pombe cell, useful for studying G-protein coupled	
XX	PT	receptor-regulated activity, comprises receptor-regulated signaling	
XX	PT	pathway that is derepressed during cell growth mitotic phase and	
XX	PT	reporter.	
XX	XX	Disclosure; Page 23; 117pp; English.	
XX	PS	The invention relates to a Schizosaccharomyces pombe yeast cell (I)	
XX	CC	comprising: (a) a heterologous G-Protein Coupled Receptor (GPCR)-	
XX	CC	regulated signaling pathway (PI) which is derepressed during mitotic	
XX	CC	phase of cell growth; and (b) a reporter system (RS) for reporting signal	
XX	CC	mediated by PI, where RS has reporter gene (GI) operatively linked to	
XX	CC	promoter (PR), which is regulatable by GPCR, and GI and PR is	
XX	CC	heterologous. Also described is (1) an isolated polynucleotide (IIa)	
XX	CC	comprising an sxa2 promoter, or its homologue or analogue, operatively	
XX	CC	linked to an exogenous reporter gene; (2) an isolated polynucleotide	
XX	CC	(IIb) encoding a Galpha-transplant having a nucleotide sequence from	
XX	CC	Galphaq, Galphas, Galphaoi, Galphai2, Galphai3, Galphaz, Galphai2,	
XX	CC	Galphai3, Galphai4 and Galphai6. (I), (IIa) or (IIb) is useful for	
XX	CC	studying GPCR-regulated activity, for determining the effect of a	
XX	CC	compound on GPCR-regulated activity by introducing the compound to (I)	
XX	CC	and noting the output of RS, where the compound affects the ability of	
XX	CC	orphan GPCR to regulate RS. Furthermore (I) is useful for identifying a	
XX	CC	regulator or a mutant of a component of GPCR-regulated pathway and for	
XX	CC	identifying a reagent that modulates GPCR-regulated signaling pathways,	
XX	CC	by producing a random peptide within (I) and measuring an amount of	
XX	CC	reporter activity produced. ABK95570-ABK95608 represent Galpha-	
XX	CC	transplant coding sequences and related coding sequences and PCR primers

PT Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL
PT -1, useful for treating disorders associated with decreased expression or
PT activity of human POSHL1.
PS
PS Example 2; SEQ ID NO 202; 60pp + Sequence Listing; English.
XX
CC The invention relates to an isolated SH3 domain (POSH)-like signalling
CC protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino
CC acids (S1, AB83999), a sequence having 65% sequence identity to (S1),
CC (S1) having 95% deviations, especially conservative substitutions or a
CC fragment of the sequences comprising at least 8 contiguous amino acids.
CC Human POSHL 1 is a proto-oncogene/oncogene product that functions as an
CC adaptor protein that interacts with Rho family small GTPases as well as
CC downstream components of the signal transduction pathway. (I) is useful
CC for identifying a specific binding partner. (I) and nucleic acids (II)
CC encoding (I) are useful for diagnosing, monitoring disease and treating
CC caused by altered expression of human POSHL1 including diagnosing and
CC treating cancer, they useful in the development of vaccines and (II) is
CC useful in gene therapy. (II) is useful for constructing microarrays which
CC are useful for measuring and for surveying gene expression and creating
CC transgenic non-human animals capable of producing the proteins. The
CC present sequence is that of a scanning oligonucleotide useful in examples
CC of the invention. Note: The present sequence did not form part of the
CC printed specification, but is based on sequence information supplied to
CC Derwent by the European Patent Office

XX Novel isolated polypeptides useful for diagnosis of prostate cancer.
XX
XX Claim 18; Page 151; 152pp; English.
XX
XX The invention describes novel isolated polypeptides (I, Ib) useful for

CC diagnosing prostate cancer comprising obtaining a patient sample
CC containing prostate cells and detecting the presence or absence of an
CC expression product of a HML-2 endogenous retrovirus in a patient sample.
CC Polynucleotides associated with (I) are useful for diagnosis or treatment
CC of testicular cancer, multiple sclerosis or insulin-dependent diabetes
CC mellitus. An inhibitor of a HML-2 protease and a transdominant negative
CC mutant of HML-2 CORP are also useful in the manufacture of a medicament
CC for treating prostate cancer. (I) and (Ib) are useful for generating
CC antibodies specific to the polypeptides associated with cancer, as
CC targets for therapeutic intervention, and in immunising a transgenic
CC animal. This sequence represents a probe used for detecting the presence
CC of human endogenous retrovirus (herv) of the HML-2 sub-group in prostate
CC tissue

XX Enzymatic polynucleotide that down regulates expression of chloride
XX channel calcium activated gene, useful for treating chronic obstructive
XX pulmonary disease (COPD), chronic bronchitis and asthma.
XX
XX Claim 4; Page 113; 152pp; English.
XX
XX The invention relates to enzymatic nucleic acid molecules that down
XX regulate expression of chloride channel calcium activated 1 (CLCA1) genes
XX by cleaving RNA derived from the genes. The nucleic acid sequences are
XX useful as pharmaceutical agents for treating conditions such as chronic
XX obstructive pulmonary disease (COPD), chronic bronchitis, asthma, cystic
XX fibrosis, obstructive bowel syndrome and any other diseases or conditions
XX that are related to or will respond to the levels of CLCA1 in a cell or

CC tissue. The sequences are useful for reducing CLCA1 activity in a cell,
 CC hence, are useful for treatment of a patient having a condition
 CC associated with the level of CLCA1, where the invention further comprises
 CC the use of one or more therapies under conditions suitable for the
 CC treatment, for example, oxygen therapy, bronchodilators, corticosteroids,
 CC antibacterials, vaccinations, acetylcysteine and mucokinetic agents. The
 CC nucleic acids of the invention are also used as diagnostic tools to
 CC examine genetic drift and mutations within diseased cells or to detect
 CC the presence of CLCA1 RNA in a cell. This sequence represents an
 CC enzymatic nucleic acid molecule of the invention

PT New GPCR-A-1 nucleic acid and polypeptide, useful for diagnosing,
PT investigating and/or treating disorders associated with aberrant
PT expression or activity of GPCR-A-1, such as tumors and cancers.
XX
PS Example 2; SEQ ID NO 225; 156pp; English.
XX
CC The invention describes an isolated nucleic acid encoding a G protein
CC coupled receptor (GPCR), mutations of which cause cancer, comprising a
CC 2225 or 1921 base pair sequence, or their degenerate variants, encoding a
CC 409 residue amino acid sequence, all given in the specification, with or
CC without conservative amino acid substitutions, or complements of the
CC sequence of them. The encoding nucleic acid is not more than 100 kbases in
CC length. The methods and compositions of the present invention are useful
CC for diagnosing, investigating and/or treating disorders associated with
CC aberrant expression or activity of GPCR-A-1, such as tumours and cancers.
CC This sequence represents an oligonucleotide used to analyse the gene
CC encoding human G-protein coupled receptor GPCR-A-1

PT and transfected cells.
XX
XX Disclosure; Page 94; 720pp; French.
XX
XX The invention relates to a novel isolated 17 mer nucleic acid sequence,
CC given in the specification, a sequence containing at least 15 consecutive
CC nucleotides from the 17 mer sequence, a sequence with, after optimal
CC alignment, at least 80 % identity to the 17 mer sequence, a sequence that
CC hybridizes to them under highly stringent conditions, or the complement
CC of any of them, or the corresponding RNA. The novel isolated nucleic
CC acids of the invention are useful as probes and primers for detecting,
CC identifying, quantifying and/or amplifying a nucleic acid, e.g. as one
CC component of a gene chip, in vitro as (anti)sense reagents, and for
CC production of recombinant polypeptides. Any of the nucleic acids,
CC polypeptides, vectors containing the nucleic acids, cells containing the
CC vector or antibodies directed against the polypeptides are useful for
CC preparation of pharmaceuticals for prevention and/or treatment of viral
CC diseases that are characterised by development of tumours or cell
CC degeneration, specifically cancer but also Alzheimer's disease and
CC schizophrenia. Analysis of the expression of the 17 mer nucleic acids in
CC patient samples is useful for diagnosis and/or prognosis of these
CC diseases. The polypeptides can also be used to generate antibodies, and
CC both the polypeptide and antibodies are useful as components of protein
CC chips. The nucleic acid sequences of the invention can be used in gene
CC therapy. This polynucleotide sequence represents a tumour suppression
CC related human fukutin oligonucleotide of the invention

CC	acids of the invention are useful as probes and primers for detecting,
CC	identifying, quantifying and/or amplifying a nucleic acid, e.g. as one
CC	component of a gene chip, in vitro as (anti)sense reagents, and for
CC	production of recombinant polypeptides. Any of the nucleic acids,
CC	polypeptides, vectors containing the nucleic acids, cells containing the
CC	vector or antibodies directed against the polypeptides are useful for
CC	preparation of pharmaceuticals for prevention and/or treatment of viral
CC	diseases that are characterised by development of tumours or cell
CC	degeneration, specifically cancer but also Alzheimer's disease and
CC	schizophrenia. Analysis of the expression of the 17 mer nucleic acids in
CC	patient samples is useful for diagnosis and/or prognosis of these
CC	diseases. The polypeptides can also be used to generate antibodies, and
CC	both the polypeptide and antibodies are useful as components of protein
CC	chips. The nucleic acid sequences of the invention can be used in gene
CC	therapy. This polynucleotide sequence represents a tumour suppression
CC	related human fukutin oligonucleotide of the invention

PT	Novel enzymatic nucleic acid molecules which down regulates expression of
PT	a sequence encoding a subunit of nuclear factor kappa B useful for
PT	treating cancer, inflammatory disorders and autoimmune diseases.
XX	
PS	Claim 3; Page 37; 72pp; English.
XX	
CC	The invention describes an enzymatic nucleic acid molecule (I) which down
CC	regulates expression of a sequence encoding a subunit of nuclear factor
CC	kappa B (NFKB), where (I) is an inozyme, zinzyme, G-cleaver or amberzyme
CC	configuration. The enzymatic nucleic acid molecule is adapted to treat
CC	cancer and is useful for down-regulating REL-A activity in a cell, for
CC	treating a patient having a condition associated with the level of REL-A.
CC	(I) is useful for cleaving RNA comprising a sequence of REL-A gene, in
CC	the presence of a divalent cation, especially Mg ²⁺ . The enzymatic and
CC	antisense nucleic acid molecules are useful for treating breast, lung,
CC	prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic,
CC	cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or
CC	multidrug resistant cancer. The method involves use of other drug
CC	therapies such as monoclonal antibodies, docetaxel, cisplatin, methotrexate,
CC	chemotherapy including paclitaxel, doxorubicin, fluorouracil, edatrexate,
CC	cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate,
CC	gemcitabine or radiation therapy. The enzymatic and antisense nucleic
CC	acid molecules are also useful for treating inflammatory disease such as
CC	rheumatoid arthritis, restenosis, asthma, Crohn's disease, diabetes,
CC	obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft
CC	rejection, gene therapy applications, ischaemia/reperfusion injury
CC	(central nervous system (CNS) and myocardial), glomerulonephritis,
CC	sepsis, allergic airway inflammation, inflammatory bowel disease or
CC	infection. This sequence represents the substrate of a novel enzymatic
CC	nucleic acid molecule

 XX
 CC The invention relates to a novel short interfering RNA (siRNA) nucleic
 CC acid molecule or an enzymatic nucleic acid molecule, that modulates
 CC expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras,
 CC human immunodeficiency virus (HIV) or a component of HIV. The nucleic
 CC acid molecule of the invention has cytostatic, anti-HIV, and anti-
 CC rheumatic activity. The nucleic acid molecules are useful for reducing
 CC HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are
 CC also useful for treating breast, ovarian, colorectal, lung, prostate,
 CC bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences

PT Novel short interfering RNA and enzymatic nucleic acid useful for
PT treating cancer, modulates the expression of a nucleic acid encoding
PT HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences.
XX PS Claim 4; Page 140; 185pp; English.
XX
CC The invention relates to a novel short interfering RNA (siRNA) nucleic
CC acid molecule or an enzymatic nucleic acid molecule, that modulates
CC expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras,
CC human immunodeficiency virus (HIV) or a component of HIV. The nucleic
CC acid molecule of the invention has cytostatic, anti-HIV, and anti-
CC rheumatic activity. The nucleic acid molecules are useful for reducing
CC HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are
CC also useful for treating breast, ovarian, colorectal, lung, prostate,
CC bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences
CC shown in ABZ59889 - ABZ62216, ABZ64544 - ABZ65531, ABZ66520 - ABZ66524,

 XX
 XX The present invention relates to murine oligonucleotides (ACC62754-
 XX ACC68806), which are associated with tumour suppression, tumour
 XX reversion, apoptosis and virus resistance. The oligonucleotides are
 XX useful as (1) as probes and primers for detecting, identifying,
 XX quantifying and/or amplifying nucleic acid, e.g. as one component of a
 XX gene chip; in vitro as (anti)sense reagents; and (2) for production of
 XX recombinant polypeptides. The oligonucleotides are useful for preparation
 XX of pharmaceuticals for prevention and/or treatment of viral diseases that
 XX are characterised by development of tumours or cell degeneration,
 XX specifically cancer but also Alzheimer's disease and schizophrenia

 PT and transfected cells.

XX
 PS Disclosure; Page 144; 738pp; French.

XX
 CC The present invention relates to murine oligonucleotides (ACC62754-
 CC ACC68806), which are associated with tumour suppression, tumour
 CC reversion, apoptosis and virus resistance. The oligonucleotides are
 CC useful as (1) as probes and primers for detecting, identifying,
 CC quantifying and/or amplifying nucleic acid, e.g. as one component of a
 CC gene chip; in vitro as (anti)sense reagents; and (2) for production of
 CC recombinant polypeptides. The oligonucleotides are useful for preparation
 CC of pharmaceuticals for prevention and/or treatment of viral diseases that
 CC are characterised by development of tumours or cell degeneration,
 CC specifically cancer but also Alzheimer's disease and schizophrenia

 CC The invention relates to the isolation of 6327 nucleotide sequences,
 CC fragments of at least 15 consecutive nucleotides of these nucleotides, a
 CC sequence having at least 80% identity, after optimal alignment, with the
 CC nucleotides, a sequence that hybridizes under stringent conditions with
 CC the nucleotides, or the complement, or corresponding RNA, of the
 CC nucleotides. The nucleotides are used as probes or primers for detecting,
 CC identifying, quantifying and/or amplifying nucleic acids, as in vitro
 CC sense and antisense sequences, of nucleotides involved in tumour
 CC suppression or reversion, apoptosis and or viral resistance, to produce
 CC recombinant polypeptides, and to prepare transgenic animals, as
 CC experimental models. The nucleotides (also vectors containing them and
 CC cells containing the vectors), the encoded polypeptides and antibodies
 CC (Ab) against the polypeptide are useful for prevention and/or treatment
 CC of viral infections or diseases characterized by development of tumours
 CC or cell degeneration (e.g. Alzheimer's disease or schizophrenia).
 CC Analysis of the expression of the nucleotides can be used for diagnosis
 CC and/or prognosis of these diseases. The nucleotides and polypeptides can
 CC also be used to screen for their specific interactive molecules,
 CC potentially useful for treating diseases associated with abnormal
 CC expression of the nucleotides.

 PT protein.
 PT
 XX Example 2; SEQ ID NO 34; 149pp; English.
 PS
 XX The invention relates to an isolated human GTP-activator protein for Rab-
 CC like GTPase (GAPN) polypeptide (I), a sequence having 65% identity to
 CC (I), a sequence in which at least 95% of deviations from (I) are
 CC conservative substitutions, or a fragment of at least 8 contiguous amino
 CC acids of (I). The polypeptide is useful for identifying a specific
 CC binding partner for itself, by contacting the polypeptide in vivo to a
 CC potential binding partner and determining if the polypeptide binding
 CC partner binds to the polypeptide. (I) and a nucleic acid encoding the
 CC polypeptide (II) are useful for diagnosing or monitoring a disease caused
 CC by altered expression of GAPN, by determining the level of expression of
 CC GAPN in a sample of nucleic acids or proteins that derives from a subject
 CC suspected to have the disease, alterations from a normal level of
 CC expression providing diagnostic and/or monitoring information. (I), (II)
 CC or agonist of (I) is useful for treating or preventing a disorder
 CC associated with decreased expression or activity of GAPN, and an
 CC antagonist of (I) is useful for treating or preventing a disorder
 CC associated with increased expression or activity of GAPN (all claimed).
 CC (I) is useful as immunogen to raise antibodies that specifically
 CC recognize GAPN proteins. (II) is useful to drive in vivo expression of
 CC GAPN proteins, and as hybridization probes to detect, characterize and
 CC quantify GAPN nucleic acids in and isolate GAPN nucleic acids from both
 CC genomic and transcript-derived nucleic acid samples. This sequence
 CC represents a 17-mer oligonucleotide spanning the GAP_N DNA sequence.

 XX Example; Page 55; 75pp; English.
 XX AAT30546-T30558 represent probes for the J chains of an antibody produced
 XX by the hybridoma cell HNK-20. AAT30555-T30558 represent probes for the
 XX heavy chain of the HNK-20 antibody. HNK-20 is a murine hybridoma cell
 XX line, that produces IGA specific for the F glycoprotein of respiratory
 XX syncytial virus (RSV). The variable chain coding sequences (see AAT30456-
 XX T30458) were isolated using primers specific for the 5' untranslated
 XX region of the variable region, and for the intron downstream of the
 XX rearranged J region (see AAT30459-T30545). The amplified sequences can be
 XX inserted into vectors containing heterologous (such as human) constant
 XX region genes, for the production of chimeric and isotype-switched
 XX antibodies. The antibodies are useful in the treatment and diagnosis of
 XX infection by RSV, such as pneumonia and bronchiolitis, in humans and
 XX animals. By using genomic DNA as a template, variable region genes can be
 XX isolated without producing fragments that have to be adapted for
 XX recombinant antibody expression. Also, by using the genomic DNA, no
 XX knowledge of the DNA sequence encoding the target variable region is
 XX required. Chimeric antibodies produced from the encoded proteins, that
 XX contain the constant region of the host being treated, are less likely to
 XX cause adverse immune reactions

XX Nucleic acid comprising altered alpha-virus non-structural protein gene -
PT useful for generating expression cassettes for production of recombinant
PT proteins in vertebrate or insect cells.
XX
XX Example 6; Page 164; 309pp; English.
XX
XX This oligonucleotide comprises the Bsu site (nucleotides 8887-8902) of
CC Sindbis virus. Defective helper structural protein constructs of the
CC invention can contain an intact or deleted form of this sequence. Such
CC constructs can be used in the construction of alphavirus packaging cell
CC lines with 'hybrid' structural proteins comprising sequences from other
CC alphaviruses or togaviruses. The present invention provides alphavirus-
CC based vectors with reduced inhibition of cellular macromolecular
CC synthesis. Alphavirus vector constructs, replicons and eukaryotic layered
CC vector initiation systems of the invention are used: (i) to deliver a
CC selected heterologous sequence, particularly in gene therapy for
CC treatment of a wide range of infections, cancers, and autoimmune
CC diseases, or to regulate the immune system; (ii) as vaccines; (iii) to
CC inhibit pathogens; and (iv) to express heterologous products (therapeutic
CC proteins, ribozymes, and antisense sequences). Since the modified vectors
CC do not cause significant inhibition of host cell biosynthesis, they can
CC be used safely as gene therapy vectors. (Updated on 25-MAR-2003 to
CC correct PI field.)

XX Treating respiratory disease with antisense sequences directed against
PT adenosine or bradykinin receptors - with localised delivery to the
PT respiratory system, suitable for long term treatment of asthma, adult
PT respiratory distress syndrome etc.
XX
XX Claim 12; Page 8-24; 47pp; English.
XX
XX Sequences AAV46501-V47446 are anti-sense oligonucleotides that target the
CC human adenosine A1 receptor, the design of which required the secondary
CC structure of this targets mRNA. The adenosine receptor mRNA secondary
CC structure was both analysed and used to construct antisense
CC oligonucleotides containing a phosphorothioate backbone. Once the
CC antisense molecules are created they can be used to target their
CC predetermined target, thus causing the gene product to decrease. The
CC antisense oligonucleotides were targeted to specific mRNA regions
CC containing either a junction between the intron and exon, or where they
CC may overlap the initiation codon. The receptor is a member of the G-
CC protein coupled family of cell surface receptors that have 7-
CC transmembrane segments. These oligonucleotides can be used to treat or
CC prevent conditions associated with bronchoconstriction and/or lung
CC inflammation in humans or other animals e.g. asthma, pulmonary disease,
CC allergy, emphysema and cystic fibrosis

 CC The specification describes antisense oligonucleotides (AA52869-X55271)
 CC directed against at least 2 mRNAs selected from target genes, coding and
 CC non-coding regions of RNAs corresponding to target genes, gene initiation
 CC codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
 CC end and the juxta-section between coding and non-coding regions and all
 CC segments of RNAs encoding proteins associated with one or more diseases,
 CC conditions or mixtures. The antisense oligonucleotides may be derived
 CC from sequences AAX5272-74. These multiple target oligonucleotides
 CC (specifically AAX5180-271) can be used for the antisense treatment of
 CC diseases and conditions. Typical diseases and conditions are those
 CC associated with impaired respiration and inflammation, including lung
 CC diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis,
 CC acute asthma, allergies, asthma, impeded respiration, respiratory
 CC distress syndrome, pain, cystic fibrosis, pulmonary hypertension,
 CC pulmonary vasoconstriction, emphysema, chronic obstructive pulmonary
 CC disease (COPD), and cancers such as leukemias, lymphomas, carcinomas e.g.
 CC colon cancer, breast cancer, lung cancer, pancreatic cancer,
 CC hepatocellular carcinoma, kidney cancer, melanoma, hepatic metastases, as
 CC well as all types of cancers which may metastasize or have metastasized
 CC to the lungs, including breast and prostate cancer

XX New antisense oligonucleotides useful for treating e.g. pulmonary
PT vasoconstriction, inflammation, allergies, asthma, hypertension,
PT bronchitis, emphysema, respiratory distress syndrome, ischemia or
PT cancers.
XX
XX Claim 18; Page 324; 1343pp; English.
XX
XX The present invention describes a new composition comprising an antisense
CC oligonucleotide (ON) with low adenosine (up to 15%), which targets
CC nucleic acids involved in bronchoconstriction, allergies, and/or
CC inflammation. The ON can have anti-inflammatory, anti-allergic,
CC antiasthmatic, cytostatic and analgesic activities. The compositions are
CC useful for the treatment of diseases associated with inflammation,
CC impaired airways, including lung disease and diseases whose secondary
CC effects afflict the lungs of a subject. They can be used for treating
CC e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma,
CC impeded respiration, respiratory distress syndrome, pain, cystic
CC fibrosis, pulmonary hypertension, emphysema, chronic obstructive
CC pulmonary disease (COPD), and cancers such as leukaemias, lymphomas,
CC carcinomas, and cancers which may metastasise to the lungs, including
CC breast and prostate cancer. The reduction of the adenosine content of
CC ONs reduces side effects. The A-containing ONs break down with the
CC release of deoxyadenosine which activates adenosine receptors causing
CC bronchoconstriction and inflammation. AAA32313 to AAA35312 represent the
CC nucleotide sequences given in the sequence listing from the present
CC invention, which correspond to SEQ ID NO:1 to 2815, and then the last 185
CC sequences are also called SEQ ID NO:1 to 185, but the sequences differ
CC from the previously named sequences. SEQ ID NO:11 to 1680 (AAA32323 to
CC AAA33992) are specifically claimed ONs from the present invention. N.B.
CC Sequences given in the disclosure of the present invention do not match
CC up with their corresponding SEQ ID NO: sequences given in the sequence
CC listing

XX Claim 17; Page 30; 252pp; English.
XX
XX The present invention describes a pharmaceutical composition, comprising
CC at least one agent (I) that prevents, alleviates and/or inhibits
CC adenosine-mediated cardiopulmonary and/or renal damage and/or failure.
CC (I) is an adenosine A2a receptor agonist (Aa), or an oligonucleotide
CC (Ib), containing less than 15% adenosine (Aa), that is antisense to target
CC genes or corresponding RNA, to genomic flanking regions (i.e. 5' or 3'
CC segments of mRNA encoding the adenosine A1, A2a, A2b or A3 receptors, and
CC has A1, A2b or A3 agonist activity or A2a antagonist activity (or at
CC least no agonist activity at this receptor). (I) may be a mixture of (Ia)
CC and (Ib), and optionally also contains one or more surfactants. The
CC compositions are used to prevent, alleviate and/or treat adenosine
CC receptor-mediated cardiac, lung and/or renal damage or failure
CC (particularly where associated with ischaemia, toxin release and/or
CC administration of drugs or imaging agents, e.g. adenosine for treating
CC supraventricular tachycardia); (adult) respiratory distress syndrome
CC (e.g. associated with sepsis); allergic rhinitis; chronic obstructive
CC pulmonary disease; cardiopulmonary hypoxia associated with administration
CC of stress-test agents, particularly where such conditions are associated
CC with acute inflammation. AAA02717, AAA02719, AAA02721 and AAA02723 to

XX adenosine receptors during metabolism, useful e.g. for treating cancers
XX and respiratory obstructions.
XX
XX Claim 14; Page 113; 1592pp; English.
XX
XX The present invention describes low adenosine (A) content antisense
XX oligonucleotides and compositions (I) comprising them. In the antisense
XX oligonucleotides the A is replaced by a 'Universal' or alternative base.
XX (I) can have respiratory, bronchodilator, antiinflammatory, analgesic,
XX immunosuppressive, antitasthmatic, hypotensive and cytostatic activities.
XX The antisense oligonucleotides and (I) can be used to down-regulate the
XX expression and or activity of target polypeptides associated with
XX lung/respiratory disorders and malignancies, such as stimulating and
XX activating peptide factors and transmitters, transcription factors,
XX immunoglobulins and antibodies, antibody receptors, cytokines and
XX chemokines, endogenously produced specific and non-specific enzymes,
XX binding proteins, adhesion molecules and their receptors, cytokine and
XX chemokine receptors, adenosine receptors, bradykinin receptors, central
XX nervous system (CNS) and peripheral nervous and non-nervous system
XX receptors, CNS and peripheral nervous and non-nervous system peptide
XX transmitters, defensins, growth factors, vasoactive peptides and
XX receptors, binding proteins and malignancy associated proteins. The
XX antisense oligonucleotides may be used in this way to treat disorders
XX including respiratory obstruction (especially pulmonary obstruction
XX and/or bronchoconstriction) and/or lung inflammation, allergy(ies) and/or
XX surfactant hypoproduction which are associated with a disease or
XX condition selected from pulmonary vasoconstriction, inflammation,
XX allergies, asthma, impeded respiration, respiratory distress syndrome
XX (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary
XX hypertension, emphysema, chronic obstructive pulmonary disease (COPD),
XX pulmonary transplantation rejection, pulmonary infections, bronchitis,
XX and/or cancer. AAF18434 to AAF21543 represent human polynucleotide

XX New mutant replicon-defective flavivirus having a genome with a 3' stem-
XX loop structure chimeric substitution useful as vaccine for treating
XX flavivirus-induced infection e.g. dengue fever, dengue hemorrhagic
XX fever/shock syndrome.
XX
XX Example 3; Page 62; 67pp; English.
XX
XX The present invention relates to a mutant replication-defective
XX flavivirus having a genome with a 3' stem-loop structure substitution,
XX and being defective for replication in an arthropod vector that transmits
XX flavivirus to humans. The genome is selected from a first flavivirus and
XX the 3' stem-loop structure from a second flavivirus, where the first
XX flavivirus is different from the second. For example the first flavivirus
XX may be Dengue virus type 2 (DEN2) and the second flavivirus may be West
XX Nile virus (WN). The mutant replicon-defective flavivirus is useful as a
XX vaccine for treating flavivirus-induced infections, particularly dengue
XX fever or dengue haemorrhagic fever/shock syndrome. The present sequence
XX represents a part of the WN genome used to construct a mutant replication
XX -defective flavivirus in the examples of the present invention. (Updated
XX on 07-AUG-2003 to correct OS field.)

XX
XX Eukaryotic layered vector initiation system, for gene therapy, has
PT alphaviral nonstructural protein gene having mutant nonstructural protein
PT 2 gene, which reduces host-cell directed macromolecular synthesis.
XX
XX
XX Example 6; Col 105; 161pp; English.
XX
XX The invention relates to a eukaryotic layered vector initiation system,
XX comprising a nucleic acid sequence encoding all four alphaviral
XX nonstructural proteins and including an altered sequence encoding for
XX nonstructural protein 2, such that when the altered sequence is operably
XX incorporated into an RNA vector replicon, the time required to reach 50%
XX inhibition of cellular macromolecular synthesis in cells is increased, as
XX compared to an RNA vector replicon having a wild-type alphavirus
XX nonstructural protein 2. The initiation system comprises a 5' promoter
XX which directs synthesis of alphavirus RNA in vivo from cDNA, a 5'
XX sequence which directs transcription of alphavirus RNA, a nucleic acid
XX sequence which operably encodes all four alphaviral nonstructural
XX proteins, an alphavirus RNA polymerase recognition sequence and a 3'
XX polyadenylate tract. The eukaryotic layered vector initiation system is
XX useful for stimulating an immune response within a vertebrate, for
XX protein expression and gene therapy. The system exhibits reduced, delayed
XX or no inhibition of cellular macromolecular synthesis, thus permitting
XX its use for protein expression and gene therapy with reduced, delayed or
XX no development of cytopathic effects or cell death. This sequence
XX represents a PCR primer used in the scope of the invention

XX
XX Making a selected polypeptide comprises introducing into a cell a
PT eukaryotic layered vector initiation system, maintaining the cell for
PT expression of the selected polypeptide and expressing the selected
PT polypeptide.
XX
XX Example 6; Col 107; 162pp; English.
XX
XX The invention relates to a method of making a selected polypeptide which
XX comprises introducing into a cell a eukaryotic layered vector initiation
XX system, maintaining the cell for expression of the selected polypeptide
XX and expressing the selected polypeptide. The eukaryotic layered vector
XX initiation system comprises a 5' promoter that directs synthesis of
XX alphavirus RNA in vivo from cDNA, a 5' sequence that directs
XX transcription of alphavirus RNA, a nucleic acid that operably encodes all
XX four alphaviral nonstructural proteins, a heterologous nucleic acid
XX sequence encoding the selected polypeptide and an alphavirus RNA
XX polymerase recognition sequence. The alphavirus is Sindbis virus,
XX S.A.AR86 virus, Semliki Forest virus, Venezuelan equine encephalitis
XX virus or Ross River virus. The method is useful for making a selected
XX polypeptide. The present sequence represents a Sindbis virus PCR primer.

 PT Treating infection or reactivation caused by Herpes virus comprises using
 PT antagonist of Herpes Simplex virus polynucleotide sequence and interferon
 PT regulatory factor-1.
 XX
 XX Disclosure; SEQ ID NO 83; 53pp; English.
 PS
 CC The invention relates to treating viral infection or reactivation
 CC comprising contacting an individual with an antagonist of the interaction
 CC between a Herpes Simplex virus (HSV) polynucleotide sequence appearing as
 CC ADD07153 and interferon regulatory factor-1 (IRF-1, a transcription
 CC factor of the interferon regulatory pathway). Also included are an
 CC isolated HSV polynucleotide comprising ADD07153, a composition comprising
 CC a HSV polypeptide involved in viral infection or reactivation, screening
 CC for compounds capable of inhibiting specific binding of IRF-1 to a
 CC polynucleotide, screening for compounds capable of inhibiting specific
 CC binding of IRF-1 to IRF-1-IRF-BP (undefined) complex, a compound capable
 CC of agonising or antagonising any compound in IRF-1 and/or interferon
 CC genetic regulatory pathway and a composition for comprising an HSV IRF-1
 CC binding site consensus sequence. The method is useful for treating
 CC infection and reactivation caused by Herpes virus, e.g., HSV-1 or HSV-2
 CC infection. The HSV polypeptide and polynucleotides may also be useful as
 CC antiviral vaccines. The present sequence represents an identified viral
 CC IRF-1 binding site.

 DR
 XX Preparing a humanized antibody for preventing or treating hepatitis B

PT virus infection comprises grafting a specificity determining residue of
 PT murine monoclonal antibody to the amino acid sequences in human antibody
 PT variable regions.
 XX
 XX Example 3; SEQ ID NO 18; 67pp; English.
 PS
 CC The present invention describes a method for preparing a humanised
 CC antibody comprising selecting a specificity determining residue (SDR) of
 CC the complementarity determining region (CDR) of murine monoclonal
 CC antibody heavy chain and light chain variable regions, and grafting the
 CC SDR to at least one of the corresponding amino acid sequences into human
 CC antibody variable regions. Also described: (1) a humanised antibody
 CC prepared by the novel method, which suppresses the human anti-mouse
 CC antibody (HAMA) response to a greater extent than an antibody prepared
 CC according to CDR-grafting method; (2) a DNA encoding the humanised
 CC antibody heavy chain for the heavy chain variable region of hepatitis B
 CC virus (HBV) pre-S1 antigen, or the humanised antibody light chain for the
 CC light chain variable region of HBV pre-S1 antigen; (3) an expression
 CC vector pHuK127HC or pDCMV-dhfrC-HuK127 comprising the DNA described
 CC above for expressing the humanised antibody heavy and/or light chain for
 CC HBV pre-S1 antigen; (4) an Escherichia coli DH5alpha/pDCMV-dhfrC-HuK127
 CC (Accession Number: KCTC 10198BP) transformed with the expression vector
 CC of (3); (5) a Chinese hamster ovary (CHO) cell line CHO/HuK127
 CC (Accession Number: KCTC 10199BP) producing the humanised antibody; and
 CC (6) a composition for preventing or treating HBV infection, comprising
 CC the humanised antibody. The humanised antibody has antiinflammatory,
 CC hepatotropic and virucide activities, and can be used in gene therapy.
 CC The composition and method are useful in preventing or treating hepatitis
 CC B virus infection. The present sequence represents a PCR primer for a
 CC human heavy chain gene CH1 domain, which is used in an example from the
 CC present invention.

XX Novel human SH3 domain (POSH)-like signaling protein 1 polypeptide, POSHL
PT -1, useful for treating disorders associated with decreased expression or
PT activity of human POSHL1.
XX Example 2; SEQ ID NO 1117; 60pp + Sequence Listing; English.
PS The invention relates to an isolated SH3 domain (POSH)-like signalling
CC protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino
CC acids (SI, ABB83999), a sequence having 65% sequence identity to (SI),
CC (SI) having 95% deviations, especially conservative substitutions or a
CC fragment of the sequences comprising at least 8 contiguous amino acids.
CC Human POSHL 1 is a proto-oncogene/oncogene product that functions as an
CC adaptor protein that interacts with Rho family small GTPases as well as
CC downstream components of the signal transduction pathway. (I) is useful
CC for identifying a specific binding partner. (I) and nucleic acids (II)
CC encoding (I) are useful for diagnosing, monitoring disease and treating
CC caused by altered expression of human POSHL1 including diagnosing and
CC treating cancer, they useful in the development of vaccines and (II) is
CC useful in gene therapy. (II) is useful for constructing microarrays which
CC are useful for measuring and for surveying gene expression and creating
CC transgenic non-human animals capable of producing the proteins. The
CC present sequence is that of a scanning oligonucleotide useful in examples
CC of the invention. Note: The present sequence did not form part of the
CC printed specification, but is based on sequence information supplied to
CC Derwent by the European Patent Office

XX      New integrin beta sub-unit and its nucleic acid - forms hetero-dimers
XX      with sub-units alpha-V and alpha-F, useful as a diagnostic.
XX
XX      Disclosure; Fig 1B; 43pp; English.
XX
XX      The sequences given in AAQ27640-41 are primers which were used to amplify
XX      part of an integrin beta subunit, beta-6 cDNA. Primer BTE2F corresponds
XX      to the sequence Pro-Leu-Thr-Asn-Asp-Ala-Glu-Arg which ends approx. 49
XX      nucleotides from the 3' end of the sequence amplified by primers B1F and
XX      B2R (see also AAQ27635-6). Primer BTE3F corresponds to the sequence Val-
XX      Ser-Glu-Asp-Gly-Val. This amino acid sequence was located near the 3' end
XX      of the amplification product of BTE2F and B3R (see AAQ27638). These
XX      primers amplified further regions of the beta-6 cDNA. (See also AAQ27642-
XX      3). The beta-6 cDNA encodes a cell surface receptor which is useful in
XX      mediating critical aspects of cell processes in conjunction with an
XX      integrin alpha subunit. (Updated on 25-MAR-2003 to correct PN field.)

XX      PT DNA probe for detection of Mycorrhiza fungi - contg. complementary
XX      sequence binding specifically to Mycorrhiza fungus.
XX
XX      PS Disclosure; Page 5; 8pp; Japanese.

```

XX The sequence MP2 is an example of a probe contg. DNA complementary to
CC nucleic acid of Mycorrhiza fungi. The probe specifically binds to a
CC segment of the 18S rRNA of the RNA-encoding DNA of Mycorrhiza fungi. Such
CC a probe is useful for the detection of Mycorrhiza fungi, esp. that of
CC Tricholoma matsutake or Lycophyllum shineji, and for detection of rooting
CC or growth of hyphae of Mycorrhiza to a host plant, e.g. pine. See also

XX Oligo:nucleoside compounds for cleaving RNA - having a sequence that is
PT complementary to a target nucleic acid strand and a non-complementary
PT portion.
PT
XX
XX Disclosure; Page 93; 109pp; English.
PS
XX
XX This invention describes a novel oligonucleoside compound for hybridising
CC to a target nucleic acid strand. The oligonucleoside comprises (a) an
CC oligonucleoside sequence that is complementary to a target region or
CC subregion of the target nucleic acid strand and (b) a portion that is non
CC complementary to a target site in the target region or subregion such
CC that, when the oligonucleoside compound is hybridised to the target
CC strand, a base group at the site is oriented away from an inter-strand
CC orientation. The oligonucleoside and combinations are used for inhibiting
CC production of a selected protein in a cell by effecting cleavage at a
CC site in a target region of cellular RNA that codes for the selected
CC protein. They can be used for treating a condition in a mammal that is
CC caused by the production of a selected protein. The oligonucleosides are
CC target-mRNA-specific and can be used against mRNA specific to a
CC particular disease state. They are relatively harmless to non-targeted
CC nucleic acid. The non-complementary unit enhances internucleotidyl bond
CC cleavage

XX
XX Claim 2; Page 201; 407pp; English.
XX
CC The present sequence represents a preferred target sequence for an
CC enzymatic nucleic acid (i.e. a ribozyme) which cleaves ICAM-1 mRNA at the
CC nucleotide base position indicated in the DE line. Regions of the mRNA
CC that do not form secondary folding structures and that contain potential
CC hammerhead and hairpin ribozyme cleavage sites were identified by
CC computer analysis. Ribozymes directed against these mRNA sequences were
CC designed and synthesised with modifications that improve their nuclease
CC resistance. The ribozymes cleave the ICAM-1 target sequences and thereby
CC inhibit ICAM-1 expression, making them useful for reducing transplant
CC rejection and alleviating symptoms in patients with rheumatoid arthritis,
CC asthma and other inflammatory disorders. (Updated on 25-MAR-2003 to
CC correct PI field.)

XX
CC Primer ICE-RT (AAT38208) is derived from the 3' untranslated sequence of
CC human interleukin-1 beta converting enzyme (ICE). It was used to produce
CC cDNA from poly-A+ RNA of the human T-cell line Jurkat and from total RNA
CC of the human monocyte cell line THP-1. The cDNA was subsequently
CC amplified (see also AAT38209-10) and cDNA clones (AAT38204-07) coding for

CC novel isoforms (AAM00993-96) of human ICE were isolated

XX for treating restenosis or cancer.
XX
PS Claim 1; Page 70; 128pp; English.
XX
CC The present sequence represents the preferred target sequence for an
CC enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves
CC the human c-myb sequence at the base position indicated in the descriptor
CC line. The c-myb sequence was screened for optimal ribozyme target sites
CC using a computer folding algorithm, and regions of the mRNA which did not
CC form secondary folding structures and contained potential ribozyme
CC cleavage sites were identified. Ribozymes were synthesised and their
CC activities optimised by either varying the length of the binding arms or
CC by modification to prevent degradation by nucleases. The ribozymes cleave
CC the c-myb sequence and can be used to prevent smooth muscle cell
CC hyperproliferation in restenosis, especially after coronary angioplasty,
CC and in cancers

XX  the treatment of arthritis, induction of graft tolerance or treatment of
XX  auto-immune diseases.
XX
XX  Example 1; Page 154; 307pp; English.
XX
XX  The present invention describes a novel enzymatic nucleic acid (ENA)
XX  having a hammerhead motif (HM) comprising: (i) at least 5 ribose residues
XX  ; (ii) a 2'-C-allyl modification at position 4 of the ENA; (iii) at least
XX  ten 2'-O-methyl modifications; and (iv) a 3'-end modification. The ENA's
XX  can inhibit collagenase and stromelysin production in the synovial
XX  membrane of joints for the treatment or prevention of arthritis,
XX  particularly osteoarthritis or rheumatoid arthritis. The ENA's can also
XX  be used to treat antigen presenting cells of a donor to induce tolerance
XX  in a recipient to an alloantigen of a donor. They can also be used for
XX  enhancing graft tolerance or for treating autoimmune disease, and for
XX  treating allergies and other inflammatory conditions. The ENA's can also
XX  be used in diagnosis. Ribozyme therapy impacts on the expression of
XX  stromelysin without introducing the non-specific effects upon gene
XX  expression which accompany treatment with retinoids and dexamethasone.
XX  The concentration of ribozyme required to affect a therapeutic treatment
XX  is lower than that required of antisense molecules, and is highly
XX  specific. The present sequence is used in the exemplification of the
XX  present invention

```

PT RNA from haematopoietic cells with primers for the bcr2-abl2 and bcr3-
 PT abl2 trans-location regions.
 XX
 PS Claim 6; Page 12; 79pp; English.
 XX
 CC AAT91749-T91763, and AAT91765-T91792 are primers used in the method of
 CC the invention. AAT91754-T91759 can also be used as capture
 CC oligonucleotides (ON), while AAT91760-T91763, AAT91791 and AAT91792 can
 CC also be used as detector agents. The method of the invention is for
 CC detecting or monitoring chronic myelogenous leukaemia (CML) cells in a
 CC human patient. The method comprises obtaining RNA from haematopoietic
 CC cells of the patient, and amplifying it using a pair of primers that
 CC amplify both the bcr2-abl2 and bcr3-abl2 translocation regions. The
 CC amplified sequence is contacted with a capture agent comprising a capture
 CC ON and a binding ligand to form a capture mixture. The capture ON is
 CC specific for the bcr2-abl2 and bcr3-abl2 translocation regions. The
 CC mixture is contacted with a solid phase coupled to a receptor specific
 CC for the binding ligand. The solid phase is washed, then contacted with a
 CC detector agent comprising a detector ON specific for the bcr2-abl2 or
 CC bcr3-abl2 translocation regions and a label. The amount of labelled
 CC detector ON bound to the solid phase is then correlated with the presence
 CC or quantity of CML cells in the patient. The method is to detect or
 CC monitor CML cells in patients. It can also be used prognostically to
 CC assess cytogenetic remission in patients with CML. The method detects
 CC both the bcr2-abl2 and the bcr3-abl2 translocations associated with CML.
 CC The assay does not detect CML in the absence of the Ph chromosome, nor
 CC does it detect acute lymphotrophic leukaemia (ALL) even if the ALL
 CC patient has the Ph chromosome. (Updated on 25-MAR-2003 to correct PI
 CC field.)

 PT Enzymatic nucleic acid molecules which specifically cleave RNA derived

PT from a c-fos gene - useful for treating conditions related to levels of c
 PT -fos, especially cancer.
 XX
 PS Claim 2; Page 51; 72pp; English.
 XX
 CC The present invention describes an enzymatic nucleic acid molecule which
 CC specifically cleaves RNA derived from a c-fos gene. AAV95401 to AAV95540
 CC and AAV95541 to AAV95584 represent hammerhead ribozymes and hairpin
 CC ribozymes, respectively, which specifically cleave human c-fos. AAV95261
 CC to AAV95400 and AAV95585 to AAV95628 represent human c-fos target
 CC sequences. The enzymatic nucleic acid molecules can be used for treating
 CC cancer associated with elevated levels of c-fos oncogene, especially
 CC leukaemias, neuroblastomas and lung, breast and colon cancers. The
 CC ribozymes may also be used as diagnostic tools to examine genetic drift
 CC and mutations within diseased cells, or to detect the presence of c-fos
 CC RNA in a cell

 XX
 PS Claim 12; Page 8-24; 47pp; English.
 XX
 CC Sequences AAV46501-VA7446 are anti-sense oligonucleotides that target the

CC human adenosine A1 receptor, the design of which required the secondary
 CC structure of this targets mRNA. The adenosine receptor mRNA secondary
 CC structure was both analysed and used to construct antisense
 CC oligonucleotides containing a phosphorothioate backbone. Once the
 CC antisense molecules are created they can be used to target their
 CC predetermined target, thus causing the gene product to decrease. The
 CC antisense oligonucleotides were targeted to specific mRNA regions
 CC containing either a junction between the intron and exon, or where they
 CC may overlap the initiation codon. The receptor is a member of the G-
 CC protein coupled family of cell surface receptors that have 7-
 CC transmembrane segments. These oligonucleotides can be used to treat or
 CC prevent conditions associated with bronchoconstriction and/or lung
 CC inflammation in humans or other animals e.g. asthma, pulmonary disease,
 CC allergy, emphysema and cystic fibrosis

 XX PT New enzymatic nucleic acid(s) - useful for, e.g. reducing alkaloid
 XX PT biosynthesis or regulating flowering.
 XX PS Claim 53; Page 54; 79pp; English.

CC The present invention describes enzymatic nucleic acid molecules with RNA
 CC -cleaving activity (e.g. ribozymes) which are capable of modulating the
 CC expression of plant genes: (i) involved in biosynthesis of alkaloids; or
 CC (ii) involved in flower formation. AAV95982 to AAV96334, and AAV96335 to
 CC AAV96354 represent potato solanidine glucosyltransferase hammerhead and
 CC hairpin ribozymes, respectively. AAV95629 to AAV95981, and AAV96355 to
 CC AAV96734 represent potato solanidine glucosyltransferase target
 CC sequences. AAV96773 to AAV97170, and AAV97171 to AAV97195 represent
 CC potato citrate synthase hammerhead and hairpin ribozymes, respectively.
 CC AAV96735 to AAV96772, and AAV97196 to AAV97220 represent potato citrate
 CC synthase target sequences. Ribozymes of the present invention can be used
 CC to inhibit the synthesis of toxic alkaloids in solanaceous plants,
 CC particularly potato but also tomato, pepper, aubergine and ditura or to
 CC inhibit flowering in potato, lettuce, spinach, cabbage, brussel sprouts,
 CC arugula, kale, collards, chard, beet, turnip, sweet potato and turf
 CC grass. Also the ribozymes can be used for RNA manipulation in the same
 CC way that restriction endonucleases are for DNA, as well as to examine
 CC genetic drift and mutations in plants and to detect specific RNA. The
 CC ribozymes can be targeted to specific genes or to consensus sequences
 CC within a family of related genes, and being catalytic need to be present

 XX PT New enzymatic nucleic acid(s) - useful for, e.g. reducing alkaloid
 XX PT biosynthesis or regulating flowering.
 XX PS Claim 13; Page 46; 79pp; English.

CC The present invention describes enzymatic nucleic acid molecules with RNA
 CC -cleaving activity (e.g. ribozymes) which are capable of modulating the
 CC expression of plant genes: (i) involved in biosynthesis of alkaloids; or
 CC (ii) involved in flower formation. AAV95982 to AAV96334, and AAV96335 to
 CC AAV96354 represent potato solanidine glucosyltransferase hammerhead and
 CC hairpin ribozymes, respectively. AAV95629 to AAV95981, and AAV96355 to
 CC AAV96734 represent potato solanidine glucosyltransferase target
 CC sequences. AAV96773 to AAV97170, and AAV97171 to AAV97195 represent
 CC potato citrate synthase hammerhead and hairpin ribozymes, respectively.
 CC AAV96735 to AAV96772, and AAV97196 to AAV97220 represent potato citrate
 CC synthase target sequences. Ribozymes of the present invention can be used
 CC to inhibit the synthesis of toxic alkaloids in solanaceous plants,
 CC particularly potato but also tomato, pepper, aubergine and ditura or to
 CC inhibit flowering in potato, lettuce, spinach, cabbage, brussel sprouts,
 CC arugula, kale, collards, chard, beet, turnip, sweet potato and turf
 CC grass. Also the ribozymes can be used for RNA manipulation in the same
 CC way that restriction endonucleases are for DNA, as well as to examine
 CC genetic drift and mutations in plants and to detect specific RNA. The
 CC ribozymes can be targeted to specific genes or to consensus sequences
 CC within a family of related genes, and being catalytic need to be present
 CC at only very low concentrations

CC A method has been developed for the identification of a nucleic acid
 CC capable of modulating a process in a biological system. The method
 CC comprises: (a) introducing into the system a random library of nucleic
 CC acid catalysts (NAC) having a substrate binding domain (SBD), comprising
 CC a random sequence, and a catalytic domain (CD); and (b) identifying NAC
 CC in systems where modulation has occurred and/or determining the sequence
 CC of at least part of the SBDs in such systems. Nucleic acid molecules with
 CC endonuclease activity and catalytic activity, from the present invention,
 CC are used to modulate gene expression in plant and mammalian cells and to
 CC cleave target nucleic acid, particularly for treating systemic diseases

CC caused by specific RNA, e.g. cancer, inflammation, psoriasis, non-hepatic
 CC ascites and infection. They may also be used to detect genetic drift and
 CC mutations in diseased cells and to determine c-raf RNA. Specifically NACs
 CC with RNA-cleaving activity that modulate expression of the Raf gene, are
 CC used to treat cancer, restenosis, psoriasis or rheumatoid arthritis, or
 CC generally any condition associated with the level of c-raf. Introduction
 CC of sugar/phosphate modifications increases stability against nuclease and
 CC activity. AAV90922 to AAV93877 represent NACs that can be used in the
 CC method, specifically for modulating the expression of a Raf gene

 PT New antisense oligonucleotides used in treatment of, e.g. pulmonary
 PT vasoconstriction.

XX Disclosure; Page 33; 120pp; English.

XX The specification describes antisense oligonucleotides (AA52869-X55271) directed against at least 2 mRNAs selected from target genes, coding and non-coding regions of RNAs corresponding to target genes, gene initiation codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'-end and the juxta-section between coding and non-coding regions and all segments of RNAs encoding proteins associated with one or more diseases, conditions or mixtures. The antisense oligonucleotides may be derived from sequences AA55272-74. These multiple target oligonucleotides (specifically AA55180-271) can be used for the antisense treatment of diseases and conditions. Typical diseases and conditions are those associated with impaired respiration and inflammation, including lung diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis, acute asthma, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, pulmonary vasoconstriction, emphysema, chronic obstructive pulmonary disease (COPD), and cancers such as leukemias, lymphomas, carcinomas e.g. colon cancer, breast cancer, lung cancer, pancreatic cancer, hepatocellular carcinoma, kidney cancer, melanoma, hepatic metastases, as well as all types of cancers which may metastasize or have metastasized to the lungs, including breast and prostate cancer

CC AA62029 and AA62029 represent PCR primers and probes used

CC for detecting and/or identifying human papillomavirus (HPV) present in a
 CC biological sample. The method comprises amplification of a polynucleic
 CC acid fragment of HPV using a 5'-primer specifically hybridizing to the A
 CC region or B region of the genome of at least one HPV type, and a 3'-
 CC primer specifically hybridizing to the C region of at least one HPV type,
 CC and hybridisation of the amplified fragments with at least one probe
 CC capable of specific hybridization with the D region of at least one HPV
 CC type. The primers individually or as a combination of 5'-primer and 3'-
 CC primer, and the probes are used in the detection and/or identification of
 CC HPV present in a biological sample. An isolated HPV polynucleotide, or
 CC fragment, can also be used as a primer in a method for detection and/or
 CC identification of HPV present in a sample. Identification of the
 CC different HPV genotypes may have great clinical and epidemiological
 CC importance. The presence of high-risk HPV types is a prognostic marker
 CC for development and detection of cervical cancer

XX

PT Synthetic nucleic acid with at least one codon replaced by a synonym -
 PT for producing viral particles and in gene therapy.

XX Example 9; Page 58; 129pp; English.

XX This is the nucleotide sequence of a Thr(ACA) tRNA probe. 22 tRNA probes
 CC (see AAX07017-38) are provided, each being specific for a particular
 CC isoacceptor transfer RNA. They were used to determine the relative
 CC abundance of tRNA species in undifferentiated and differentiated mouse
 CC keratinocytes. tRNAs can be extracted from a cell or tissue, fixed to a
 CC solid support and used in hybridisation experiments with the tRNA probes.
 CC Results showed that tRNAs specific for Ala(GCA), Leu(CTT) and Leu(CTA)
 CC were increased in differentiated cells, while tRNAs or Arg(CGA), Pro(CCT)
 CC and Asn(AAG) were more abundant in undifferentiated keratinocytes. The
 CC invention arises from the discovery that the relative abundance of
 CC different isoaccepting tRNAs varies in different cells or tissues, or in
 CC cells and tissues in different states of differentiation or in different
 CC stages of the cell cycle, and that such differences may be exploited
 CC together with the codon composition of a gene to regulate and direct
 CC expression of a protein to a particular cell or tissue, or to a cell or
 CC tissue in a specific state of differentiation or in a specific stage of
 CC the cell cycle. This is particularly useful for gene therapy and for the
 CC production of virus particles in cycling eukaryotic cells

 XX cancers.
 XX
 PS Claim 18; Page 320; 1343pp; English.
 XX
 CC The present invention describes a new composition comprising an antisense
 CC oligonucleotide (ON) with low adenosine (up to 15%), which targets
 CC nucleic acids involved in bronchoconstriction, allergies, and/or
 CC inflammation. The ON can have antiinflammatory, antiallergic,
 CC antiasthmatic, cytostatic and analgesic activities. The compositions are
 CC useful for the treatment of diseases associated with inflammation,
 CC impaired airways, including lung disease and diseases whose secondary
 CC effects afflict the lungs of a subject. They can be used for treating
 CC e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma,
 CC fibrosis, pulmonary hypertension, emphysema, chronic obstructive
 CC pulmonary disease (COPD), and cancers such as leukaemias, lymphomas,
 CC carcinomas, and cancers which may metastasise to the lungs, including
 CC breast and prostate cancer. The reduction of the adenosine content of the
 CC ONs reduces side effects. The A-containing ONs break down with the
 CC release of deoxyadenosine which activates adenosine receptors causing
 CC bronchoconstriction and inflammation. AAA32313 to AAA35312 represent the
 CC nucleotide sequences given in the sequence listing from the present
 CC invention, which correspond to SEQ ID NO:1 to 2815, and then the last 185
 CC sequences are also called SEQ ID NO:1 to 185, but the sequences differ
 CC from the previously named sequences. SEQ ID NO:11 to 1680 (AAA32323 to
 CC AAA33992) are specifically claimed ONs from the present invention. N.B.
 CC Sequences given in the disclosure of the present invention do not match
 CC up with their corresponding SEQ ID NO: sequences given in the sequence
 CC listing

 DR Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers and respiratory obstructions.
 PT Claim 14; Page 112; 1592pp; English.
 XX The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense oligonucleotides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory, bronchodilator, antiinflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cycostatic activities. The antisense oligonucleotides and (I) can be used to down-regulate the expression and/or activity of target polypeptides associated with lung/respiratory disorders and malignancies, such as stimulating and activating peptide factors and transmitters, transcription factors, immunoglobulins and antibodies, antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, binding proteins, adhesion molecules and their receptors, cytokine and chemokine receptors, adenosine receptors, bradykinin receptors, central nervous system (CNS) and peripheral nervous and non-nervous system receptors, CNS and peripheral nervous and non-nervous system peptide transmitters, defensins, growth factors, vasoactive peptides and receptors, binding proteins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction and/or bronchoconstriction) and/or lung inflammation, allergy(ies) and/or surfactant hypoproduction which are associated with a disease or condition selected from pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary hypertension, emphysema, chronic obstructive pulmonary disease (COPD), pulmonary transplantation rejection, pulmonary infections, bronchitis, and/or cancer. AAF18434 to AAF21543 represent human polynucleotide fragments and antisense oligonucleotides used in the exemplification of the present invention

 Low adenosine (A) content antisense oligonucleotides which do not trigger
 adenosine receptors during metabolism, useful e.g. for treating cancers
 and respiratory obstructions.
 Claim 14; Page 113; 1592pp; English.
 The present invention describes low adenosine (A) content antisense
 oligonucleotides and compositions (I) comprising them. In the antisense
 oligonucleotides the A is replaced by a 'Universal' or alternative base.
 (I) can have respiratory, bronchodilator, antiinflammatory, analgesic,
 immunosuppressive, antiasthmatic, hypotensive and cytostatic activities.
 The antisense oligonucleotides and (I) can be used to down-regulate the
 expression and or activity of target polypeptides associated with
 lung/respiratory disorders and malignancies, such as stimulating and
 activating peptide factors and transmitters, transcription factors,
 immunoglobulins and antibodies, antibody receptors, cytokines and
 chemokines, endogenously produced specific and non-specific enzymes,
 binding proteins, adhesion molecules and their receptors, cytokine and
 chemokine receptors, adenosine receptors, bradykinin receptors, central
 nervous system (CNS) and peripheral nervous and non-nervous system
 receptors, CNS and peripheral nervous and non-nervous system peptide
 transmitters, defensins, growth factors, vasoactive peptides and
 receptors, binding proteins and malignancy associated proteins. The
 antisense oligonucleotides may be used in this way to treat disorders
 including respiratory obstruction (especially pulmonary obstruction
 and/or bronchoconstriction) and/or lung inflammation, allergy(ies) and/or
 surfactant hypoproduction which are associated with a disease or
 condition selected from pulmonary vasoconstriction, inflammation,
 allergies, asthma, impeded respiration, respiratory distress syndrome
 (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary
 hypertension, emphysema, chronic obstructive pulmonary disease (COPD),
 pulmonary transplantation rejection, pulmonary infections, bronchitis,
 and/or cancer. AAF18434 to AAF1543 represent human polynucleotide
 fragments and antisense oligonucleotides used in the exemplification of
 the present invention

XX Use of insertion sequence elements for modifying the genomes of
 PT Lactobacillus bacteria, useful for screening and integration experiments.

PS Example 1; Page 11; 19pp; English.

XX This invention describes a novel use of insertion sequences (IS) elements
 CC (I) as tools for genetically modifying the genome of Lactobacillus
 CC delbrueckii (II) or Lactobacillus helveticus (III). (I) are used as tools
 CC for genetically modifying the genome of (II) and (III). This has
 CC applications in screening experiments to identify relevant genetic
 CC functionalities, for integration experiments or for gene expression onto
 CC the bacterial genome of (II) or (III). (II) and (III) are used for the
 CC preparation of a fermented product, secondary metabolites, beta-
 CC galactosidase, cell wall protease, catabolite control protein A, lactate
 CC dehydrogenase, glycosyltransferase, a restriction system, a lysogenic
 CC prophage or the permease of the lac operon, where the gene is inactivated
 CC by insertion of at least 1 IS element. (I) are also useful for gene
 CC tagging, gene inactivation and integration and/or gene expression on a
 CC plasmid and/or genomic level. Prior art IS elements were not used for
 CC modifying Lactobacilli, as this species, used for yoghurt production,
 CC were difficult to modify. (I) provide new genetic tools for Lactobacillus
 CC species which can be used for many processes such as gene tagging, unlike
 CC prior art Lactobacilli IS elements, which are very limited. The modified
 CC bacterial strains are useful for producing a yoghurt in which post-
 CC acidification and bitter taste which occurs during storage, is
 CC significantly reduced. This sequence represents a PCR primer used in the
 CC detection of the insertion sequence element ISL5

PT      Novel nucleic acid construct for down-regulating steady state levels of
PT      proteins in plant cells, transgenic plants and their progeny.
XX
FS      Claim 21; Page 78; 114pp; English.
XX
CC      PCR primers AAZ61023-24 were used to amplify a probe (AAZ61024) which is
CC      used to isolate Zea mays delta9-desaturase DNA. The specification
CC      describes a construct encoding an antibody that can bind a transit
CC      peptide that directs an associated passenger protein to a plant cell
CC      organelle. The transit peptide sequence of the maize stearyl-ACP- delta9
CC      -desaturase (delta9-desaturase) was determined, and used to produce
CC      antibodies of the invention. These antibodies were produced in transgenic
CC      plants of the invention. The constructs of the invention are useful for
CC      producing antibodies which decrease steady state levels of passenger
CC      proteins in the organelles of plant cells and plants, by binding to the
CC      transit peptide. This results in the production of transgenic plants
CC      which have altered steady state passenger protein levels

PT      New nucleic acids that interact, and optionally cleave, target sequences,
PT      used to treat cancer.
XX
FS      Claim 77; Page 65; 148pp; English.
XX
CC      The present invention describes nucleic acids (A) that interact stably
CC      with a target sequence and contain at least one phosphorothioate
CC      link, having endonuclease activity. (A), and more generally any catalytic
CC      nucleic acid (A) that modulates expression of the oestrogen receptor
CC      gene, are used to treat cancer (particularly of the breast or endometrium), or
CC      in vivo or by transforming cells ex vivo and implanting treated cells, or
CC      for other conditions associated with levels of oestrogen receptor.
CC      Because of the high selectivity for targeted RNA, (A) can also be used to
CC      correlate inhibition of gene expression with alterations in phenotype,
CC      particularly for identification of therapeutic targets, and as research
CC      reagents (for RNA, in the same way that restriction endonucleases are
CC      used with DNA). The combination of modifications in (A) improves
CC      resistance to nucleases, binding affinity and/or activity. AAA23503 to
CC      AAA24747 represent oestrogen receptor hammerhead ribozyme sequences, and
CC      AAA24748 to AAA25992 represent their corresponding target sequences, and
CC      AAA25993 to AAA26105 represent oestrogen receptor hairpin ribozyme
CC      sequences, and AAA26107 to AAA26218 represent their corresponding target
CC      sequences. AAA26219 to AAA26271 represent other ribozyme sequences and
CC      antisense oligonucleotides used in the exemplification of the present
CC      invention
